Speaking before the Canadian Club, D. B. Hanna, chairman of the Canadian National Railways, quoted figures to show the tremendous increase in wages and the cost of materials with which the management had been confronted. At the present rate the average wage of every man, woman and office boy employed by the company would be $2,0 for 1920 contrasted with $709 ten ye ago. Yet if the Canadian Railways w allowed to charge the same freight ra as the Government owned lines of So Australia he would undertake to pay 5 per cent. on all capital invested, 5½ cent. on the Canadian national debt a have a round hundred millions to good. He did not suggest such rat but was there any reason why railwa shouldn't be allowed to live? Mr. H na's address made a deep impression his audience and he was frequen applauded.

# 2,000 A DAY

## 1/16" TURNED DOWN ON 2,000 DROP FORGINGS WITH A GEOMETRIC ADJUSTABLE HOLLOW MILLING TOOL

There is an extensive quantity of milling that is done with great economy by the use of GEOMETRIC ADJUSTABLE HOLLOW MILLING TOOLS.

Like all other Geometric Tools, the Hollow Mill is regarded as superior at home and abroad. A Sydney (New South Wales) man volunteers the good information that he has used different styles of GEOMETRIC DIE HEADS and GEOMETRIC HOLLOW MILLS quite a lot, and after cutting threads under all sorts of conditions with all sorts of methods on his side of the world and in England, he has arrived at the conclusion that the GEOMETRIC WAY CANNOT BE EQUALLED.

The Geometric Hollow Mills provide an efficient and economical method of reducing duplicate parts to an exact diameter prior to threading and for brass finishing.

Send for the Geometric Adjustable Hollow Milling Tool Booklet if you are interested, for it tells what these tools are doing.

# The National Acme Plant's Bonus System

## Several Objects In View, Among Them Being the Securing of Regular Attendance—All Must Co-operate in Order to Secure Conditions That Make the Payment of the Bonus Possible

THE payment of premiums to industrial workers for maintaining or exceeding a predetermined quantity production on a certain article is now recognized as one of the best methods of obtaining the full co-operation of the employees in solving the problem of manufacture. The varied character of the pieces produced, together with the different classes of machines and equipment necessary for production, makes it almost impossible to duplicate premium payment plans in other shops, but the principle involved is generally such that slight modifications of the details may be made so that a satisfactory working plan can be devised to conform to any or all conditions.

Early in January of this year the National Acme Co. inaugurated a premium payment plan, at their Montreal plant, that has been favorably received by the workmen, and its operation, so far, has been very successful and entirely satisfactory both to the employees and to the company. The scheme is being tried out first in connection with automatic and nut machine operators and helpers. Provision is also made to include those employees indirectly associated with the successful operation of the premium system. This is a very important factor in securing maximum efficiency from any proposed plan of this character, as the co-operation of everyone in the plant is required to maintain the spirit of harmony essential to the success of an undertaking of this kind.

### Based on Month's Work

Linemen, machine repair men and assistant foremen, who are more or less responsible for the production obtained, are rewarded on the standard of efficiency shown for the month by the department in which they are employed. These awards are made once a month and the amount of the premium is reckoned on a basis of from 10 to 15 per cent. of their month's salary, provided there has been no wilful absence from their regular duties during that period.

Regarding the actual machine operations, the operator and his helper are expected to supervise the running of four machines, and the premium system in force is of a graded character, being increased as the estimated output is obtained on two or more machines. If scheduled production is maintained on the four machines, it is possible for the operator to obtain $1.65 and the helper $1.10 over their regular day rate. Helpers are required to qualify to the satisfaction of the department foreman before they are entitled to participate in the premium payments.

Premiums are not allowed to either operator or helper for any part of the full day less than 9½ hours, for a working day of 10 hours, or for less than 4½ hours on a Saturday half-day, even though the estimated production has been obtained, as one of the primary objects was to insure regular attendance at their work for the entire day. However, provision is made for the absence of one or the other; that is, should the operator be away for a greater period than one-half hour and the helper succeeds in getting the required output, the helper will receive his allotted premium, and vice versa.

If, for any reason, it is deemed necessary to reduce the working hours for the day, the premium schedule will be revised to conform to the changed conditions. On work that requires less than a two-day run premiums are not allowed, but work of this kind is distributed as evenly as possible amongst the different operators.

Where any premium plan is in operation there is the possibility, particularly where the class of work is of a varied character, of making errors in the original estimated production. If the production is underestimated the output is revised and the premium allowed on the new estimate. Should the initial estimate exceed the possibility of paying a premium, the company consider they have assumed a loss and no payment is allowed. Where alterations are made in the method of production, such as improved machines or re-tooling, revision of production rate is made and the premium based on the new estimate.

Operators are encouraged to suggest changes that will increase production but are not permitted to adopt their own ideas without the consent and approval of the department heads. Premiums are allowed only on work accepted by inspectors. If quantity or quality is in question, the matter is investigated by the production clerk, and his decision is final.

The success or failure of this plan is decidedly up to those interested, and the scheme may be discontinued at any time, when, in the opinion of the management, production does not warrant its continuance.

### TURNING TAPERS BY SETTING OVER THE TAIL STOCK

Tapers are usually given in "inches per foot" and include the total taper or difference in diameters unless otherwise noted. In turning tapers in the lathe it is necessary to consider the total length of the bar, whether the taper extends the whole distance or not, and to set the tail stock over just as though the taper extended the whole length.

If the taper is ¾ inch per foot as in pipe threads and the whole bar is 16 inches long, then the total taper is 1 inch and the tail stock must be set over ½ inch. There is nothing to remember except to set the tail stock over half the total amount if the whole bar was tapered at the same rate.

## MR. FIELD ON THE WAY TO TORONTO

F. W. Field, the British trade commissioner for Ontario, will be returning to Toronto from the United Kingdom, on SS. Olympic, leaving on the 6th of April. Mr. Field left Toronto in the middle of October last year, and during his stay in the United Kingdom he has interviewed over 540 British manufacturers interested in trade with Canada. He has addressed numerous chambers of commerce, rotary clubs, etc., and visited over forty factories and plants. The principal commercial and industrial centres in England, Scotland and Wales were visited and Mr. Field found a widespread interest existing amongst British manufacturers regarding trade conditions and prospects of doing business in the Dominion. It is anticipated that many United Kingdom manufacturers will be visiting Canada this year, with a view to establishing business connections.

During the period of the British Industries Fair Mr. Field was in attendance at the White City and met many buyers from Canada. The attendance at the fair was highly satisfactory, nearly 65,000 visiting the White City. Overseas buyers came from fifty different countries, from Chile and China, from Sweden and Singapore. While the bulk of the foreign buyers came from Europe, Holland, Switzerland, Belgium and Scandinavia being specially well represented, the attendance from the Dominions was also considerable and many American visitors were seen.

Considering the severe and universal nature of the present trade depression, the bookings in most sections of the fair were considered satisfactory. Many firms did exceptionally heavy business, but throughout the fair as a whole business was considerably below that of last year.

## NEW CATALOGUES

Those interested in any of the catalogues described below can procure a copy of the same by writing direct to these firms. Mention that you noticed this in Canadian Machinery.

### CRANE PAMPHLET

The Shepard Electric Crane & Hoist Co., Montour Falls, N.Y., have issued a pamphlet dealing with their transfer cranes. Illustrations are shown to prove their effectiveness.

### DRILL PAMPHLET

The Aurora Tool Works, Aurora, Ind., have issued a pamphlet dealing with their 28-in. ball bearing upright drill. Full particulars of the construction of this machine is shown, also three photographs of the same. Complete specifications are included.

### KELLER PRODUCTS

The Keller Pneumatic Tool Co., Grand Haven, Mich., have issued a pamphlet dealing with their line of riveting hammers, sand rammers and drills. These are well illustrated and data pertaining to the same are given. A list of Keller products is also included.

### REAMER DATA

The Gisholt Machine Co., Madison, Wis., have issued a booklet on the subject of reamers at work. This booklet contains examples of work performed and describes in detail this company's manufacturing reamers. It concludes with a list of the various sizes procurable.

### FORCING PRESSES

The Lucas Machine Tool Co., Cleveland, Ohio, have issued various pamphlets dealing with their line of power forcing presses. These range from 15 to 50-ton capacity and a full description is given of their construction. Interesting photographs are shown of these various presses.

### STOCK LIST

The Lyman Tube & Supply Co., Ltd., Montreal, have a good method of issuing their stock lists. Enclosed in the form of a piece of tube is to be found the various stocks on hand and the very appearance of the booklet attracts one to it, ensuring its receiving the proper attention.

### BOOK ON BLOWERS

The B. F. Sturtevant Co., Hyde Park, Boston, Mass., have issued a catalogue No. 276 which describes their Design 5 Turbo-Undergrate Blower. This book discusses first the subject of such a blower, then goes into details regarding its construction, installation, etc. The second part is devoted to the care and operation of such a blower. The third portion of the book takes up the method of ordering replacements or spare parts.

### STEEL BOOK

The Vanadium-Alloys Steel Co., Latrobe, Pa., have issued a new booklet dealing with their red cut superior high speed steel. The contents deal with heat treatment, forging, annealing, hardening, double preheating, drawing or tempering, pack hardening, and uses of this particular type of steel. There is also a drill and reamer section, a roll turners' department and other interesting portions to this book, including some tables that will be useful to anyone interested in steel of any kind.

### PRESS CATALOGUE

The V. and O. Press Co., Brooklyn, N.Y., have issued a catalogue dealing with their line of presses, dies and special machinery. This includes bench, inclinable, open back double action crank, double action cam punching, arch, horning and wiring presses also presses of the reducing and hand toggle type.

Roll feed and other attachments are illustrated, including dial feed and straightening devices, and dies and special machinery conclude the book.

### PNEUMATIC TOOLS

The Globe Pneumatic Engineering Co Ltd., London, England, have issued a catalogue dealing with their line of pneumatic tools and appliances. This book covers chipping hammers, caulking hammers, riveting hammers, sealing hammers, jam riveters, chisels, snaps, drilling machines reaming machines, tapping machines, wood boring machines, air compressors, surface grinders, hose couplings and other similar lines. This is a very complete catalogue and covers quite a representative line.

### PORTABLE TOOLS

The United States Electrical Tool Co Cincinnati, Ohio, have issued a catalogue dealing with their line of portable electric tools. Breast or hand drills of various styles are shown, also applications of the same. Portable stands for such drills are described, also a style of portable radial for heavier work. Electric screw drivers electric grinders, centre grinders, internal grinders, surface grinders, bench grinders buffers and heavier styles of floor grinders are included in this catalogue.

### PORCELAIN ENAMELING FURNACES

The Chicago Flexible Shaft Co., Chicago Ill., have issued a new catalogue No. 80 which deals in detail with various of their lines. Porcelain enameling methods and furnace construction are discussed, both from the metallurgical and practical shop standpoint. This information in itself is well worth while, and to anyone interested in furnaces the data is well worth preserving.

The remaining portion of the catalogue is devoted to muffle, oven, triple purpose and crucible furnaces, also forges, pressure blowers, pyrometers and various styles of burners. Some valuable tables are also included.

### HOW I FIXED IT

This is the title of a very interesting book issued by the Greenfield Tap & Die Corp. The method of gathering the information contained in the book is rather good For some time past this concern has been anxious to know definitely what jobs farmers were using their tools for, so through the medium of three farm journals, the offered prizes for the best stories of actual jobs performed. The result, of course, is the book, and it speaks well for the company's aggressiveness that the idea has reached such a successful compiling of real information, especially to the class the want to reach. In fact this book should be of interest to everybody in general as it shows unthought of uses for such articles as this company produces.

---

### BOOK ON CAM DESIGN

The D. Van Nostrand Co., 8 Warren St., New York, have published a very interesting book entitled "Cam Design and Manufacture, by F. B. Jacobs." Canadian Machinery has had the pleasure of perusing this book, and a short portion from the preface is well worth repeating. "When cams are laid out by cut-and-dry methods they are noisy in operation create a vast amount of friction and are short-lived. On the other hand, if the curves are properly laid out, giving a possible time for the rises, the finishe

ams can be run at high speeds with very little noise or friction."

This briefly is the secret of successful cam design, and designers in general will no doubt welcome such a book, for complicated formulas have been eliminated in its preparation. The book is divided into seven chapters and is well illustrated throughout, both with photographs of modern machine tool equipment, and with line drawings showing mode of constructing various shaped cams. Following are the titles of the various chapters.

Machine cam design—gas engine cam design—cam followers—master cams—machine work on cams and cam cutters—cam cutting—while the last chapter is devoted to cam grinding.

Taken in all this book should be of real interest to anyone up against a cam problem of any nature, as the principle of any cam design is very clearly given.

## New Incorporations

General Forgings and Stampings, Ltd., has been incorporated to manufacture, sell and deal, etc., in automobiles, motor trucks, and vehicles of all kinds, with capital stock of $900,000 and head office at Merritton, Ont.

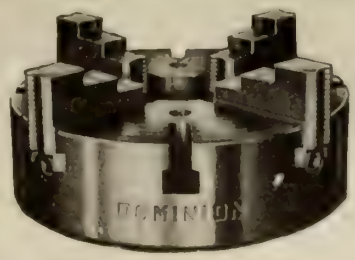
* * *

The Hercules Truck Company, Ltd., to take over the business formerly carried on by William Kerr and Enan Stanley Kerr, to manufacture, repair, etc., all kinds of trucks, automobiles, etc. Head office to be situated at Hamilton, Canada, and capital stock of $100,000.

* * *

The Happy Thought Foundry Co., Ltd., to carry on the business of manufacturers and dealers in furnaces, general machinery, iron founding, etc., with capital stock of $500,000 and head office at Brantford, Ont.

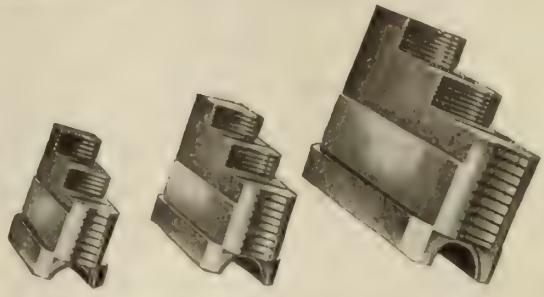
* * *



The Canadian Transit Co. with capitalization of $5,000,000 has been incorporated for the purpose of constructing and operating a railway and general traffic bridge across the Detroit River between Windsor and Detroit. The directors are given power to borrow money and issue bonds, etc., subject to and approved by the railway commission of Canada. They may not commence construction of the bridge until an act of the United States Congress has been passed approving the work.

### AUTOMATIC WARNINGS.

On one of the chief British railways nearly all the locomotives are fitted with an automatic device to warn the driver when the "home" or "distant" signals are against him. A crank is placed between the two sets of rails, and when the signals are not down it comes into contact with a lever on the engine, sounding the whistle and opening a small cock on the train pipe, thus putting on the brake. This mechanism is expected to raise still higher the standard of safety achieved in British railway operation.



### HANDY FIXTURE.

The ordinary "breast drill" is one of the most familiar of hand-operated tools and is commonly employed in workshops where small holes have to be drilled only occasionally. It may often happen, however, that it becomes necessary to drill a number of detached pieces, which could be more easily handled by a light bench drill. At the same time, the volume of such work may not be sufficient to justify the purchase of a bench drill. To meet these conditions, a British firm of engineers has introduced a small fixture which enables the ordinary breast drill to be adapted as a bench drill. It consists of a pillar, which can be bolted to the fitter's bench, carrying two arms, one of which takes the thrust at the end of the spindle, the other virtually taking the place of the operator's left hand. The feeding of the drill is operated by a treadle so that the operator's hands are free to manipulate the work and turn the drill. The whole equipment is very simple and cheap.

DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

The Jaws Are Extra Strong

THEY are drop forgings, made of best quality steel, heat-treated and hardened. The threaded portion of jaws form a half nut for the setting-up screws. Have stood the test of heavy duty work in our own shops where accuracy was the only accepted standard.

## USES and LIMITATIONS

of

Car Type and Car-and-Ball Type Furnaces

W. S. ROCKWELL CO. INDUSTRIAL FURNACES ESTABLISHED 1888 NEW YORK

are clearly defined in Bulletin 222-T

Irregular heating of high charge in car furnace, showing tendency to overheat at the top and formation of cold zone (X) at bottom due to comparatively cold hearth.

Typical installations are shown to illustrate—

The applicability of car type and car-and-ball type furnaces to the heat-treatment of material that cannot be advantageously handled in other types of furnaces.

Factors governing selection of the type (car or car-and-ball) best suited to individual manufacturing requirements.

Difference in design of each type.

Influence of unequal cooling on the quality of finished product.

*In brief, this bulletin is a discussion of principles which will appeal to those interested in furnace design, loading and handling methods, heat generation and utilization, etc.*

*Write for Bulletin 222-T*

# QUALITY and QUANTITY CIRCULATION

### *The Facts are in Demand*

THE careful buyer of advertising space demands to know the exact quality and quantity of circulation of the medium he has under consideration. Mere claims won't do any more. Cold facts must be produced—facts beyond the shadow of doubt.

Advertisers who place their messages through the columns of the MacLean Technical Papers find they get both quality and quantity circulation.

Both of these facts are actually proven by the Audit Bureau of Circulations. This A.B.C. statement counts only bona-fide, paid-for circulation. It refuses to include copies printed and distributed as specimen copies or as "bulk" subscriptions, and it tells you definitely just what kind of people read these papers.

The MacLean Technical Papers are well established. permanent powers to which anyone may turn with confidence.

**Canadian Machinery**
(Weekly)

**Power House**
(Semi-Monthly)

**Canadian Foundryman**
(Monthly)

**Marine Engineering**
(Monthly)

### *Pledges of Truth Required*

THROUGHOUT Canada you will find the great majority of sober, thinking Business Men, Engineers and Mechanics, conscientious readers of one or more of the MacLean Technical Papers. In building up this clientele of responsible readers the MacLean membership to the **Canadian National Newspapers and Periodicals Association** exerts an important influence.

Enrolment in this association demands the following pledges—"To consider first the interests of the Subscriber." "To work for truth and honesty in all departments, and among other things to supply advertisers with full information regarding character and extent of circulation."

Rigid adherence to the principles set forth above have resulted in the MACLEAN papers becoming the greatest disseminators of technical information and trade news in the British Empire.

THE monthly, semi-monthly and weekly publishing of the four papers listed above is a task that demands the utmost from a thoroughly capable organization. Technical men with years of practical experience present articles and editorials of a "better business" nature. Advertising men of proven ability plan campaigns and assist in the preparation of copy. Typesetters, press operators, proof readers, artists and even the messengers work with the all impelling incentive of better accomplishment.

To this spirit of splendid co-operation is credited the growth from a small beginning to what is now the largest publishing business of its kind in the British Empire.

# Canadian Machinery BUYERS DIRECTORY

**If what you want is not here, write us, and we will tell you where to get it. Let us suggest that you consult also the advertisers' index—last page of book, after having secured advertisers' names from this directory. The information you desire may be found in the advertising pages. This department is maintained for the benefit and convenience of our readers. The insertion of our advertisers' names under proper headings is gladly undertaken, but does not become part of an advertising contract.**

# *Extending the Range of Work a Shaper Can Handle*

MANY shops have had to make additions to the list of jobs which can be profitably handled on a shaper after putting the Hendey to the test.

In the plant where the above 20-inch Hendey Crank Shaper, and another just like it, are working, the problem of handling small lots of various shapes and sizes has been solved. Instead of going to the expense of special cutters and jigs for machining small odd lots by other methods, these jobs are run through on the versatile Hendey without trouble.

**When considering the merits of Hendey Shapers, bear in mind their reputation for solving production problems, for cutting costs and for increasing output.**

## The Hendey Machine Company

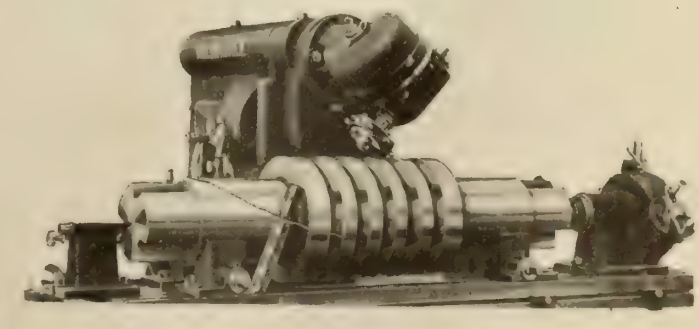
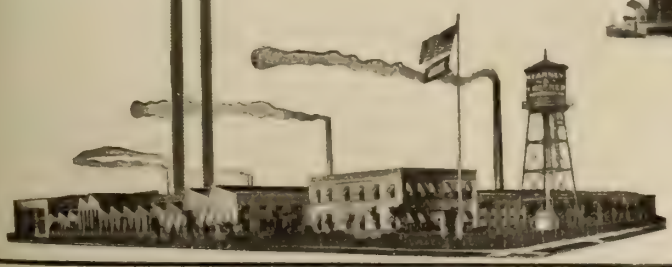
# MILWAUKEE MILLING MACHINES



## Efficient on Light and Heavy Milling



Heavy milling jobs are not unknown to Milwaukee Universal Milling Machines, while delicate and intricate ones are efficiently performed with little effort.

Both light and heavy milling operations are handled with such smoothness and accuracy that the finest results are obtained. Because Milwaukee Universal Milling Machines perform such a wide variety of work, they are particularly well adapted for the tool-room.

The jobs shown in the two illustrations are representative of "Milwaukee" adaptability. The upper illustration shows a jig being bored with a fly cutter. The lower illustrates the milling of a chilled roll with the use of a Universal Milling Attachment.

*Now* Made in Canada

# Torrington MACHINE SCREWS

## *Announcement*

ANOTHER large firm from across the border has established a branch in Canada to meet a growing demand for their products.

The makers of the well-known **Torrington** Machine Screws have opened a plant at Upper Bedford, Quebec. The demand for **Torrington** Machine Screws in Canada has been established strictly on the uniformity and superior workmanship of the product, and the plant at Upper Bedford has provided adequate means to produce Made-in-Canada **Torrington** Machine Screws equal in every particular to the screws which have hitherto been supplied to Canadian Buyers from the plant at Torrington, Conn.

When you buy **Torrington** products you can secure screws that are made to standard dimension; this enables the user to provide correct style and make tops which will insure uniform fits.

In addition to the standard line, Torrington Machine Screws are manufactured in special sizes and styles.

All you have to do to be convinced of the quality of Torrington products is to write for samples.

## THE TORRINGTON COMPANY, LIMITED

UPPER BEDFORD, QUEBEC

# STAYBOLT TAPS

## The Better the Man the More He Appreciates Them---

Not only good when new, but heat treated and seasoned to maintain this goodness. Can be ground on face of cutting edge without affecting their size. That's why you'll find Pratt and Whitney Stay Bolt Taps on the job long after cheaper, "just as good" tools are buried in the scrap pile.

Threads accurately and cleanly cut, with the least expenditure of time and effort, are other reasons why these better Taps are favorites in the shop.

If you've used them before, you know just how good they are. If you haven't, send us your first order—we know you'll be back for more. They're carried in stock in our sales rooms in all large cities.

This "BLISS" No. 80½ Straight Side Press is in the service of Ireland & Matthews Mfg. Co., Detroit. We have no statistics about it and the pile of brake drums that surrounds it so we don't know how many hours' or days' output this represents.

Whatever the rate of production, it is evident that they can't take it away fast enough to keep up with this press.

LA SALLE

Has an Advantage Over Other Grinders

There is some outstanding feature of all La Salle Grinding Machines that lends it exceptional productive ability.
The American Drill Grinder is especially adaptable for grinding twist, flat and three-lipped drills, because it has automatic lip rest and caliper jaw device, which assures proper clearance on all sizes of drills automatically. Send for descriptive matter covering our entire line of grinding machinery.

American Drill Grinder
For Wet or Dry Drill Grinding 1/8" to 2¼". Also 1/8" to 3½" dia.

"Hisco" Machine—Molded Gears

The fact that "Hisco" Machine Molded Gears require no pattern is a factor of considerable importance when the price of lumber and labor is so high. "Hisco" quality insures accurate, dependable gears. Remember — **the price of "Hisco" gears does not include the cost of patterns.**

We are also manufacturers of Steel, Chrome, Manganese and Nickel Steel Castings, Annealed and Unannealed; Cement Mill and Mining Machinery; Castings; Stamp Mills; Crushing Plants; Excavating Outfits; Steel Car Wheels; Locomotive Driving Wheels and Frames, etc.

# THE JOHNSON FRICTION CLUTCH

## The Case Against the Countershaft

The old familiar countershaft drive, through cross belts and tight and loose pulleys, stands accused of the following offences against efficiency.

In that it—

1. Involves needless equipment.
2. Costs too much to set up.
3. Prevents economical and systematic use of space.
4. Operates sluggishly.
5. Multiplies belt troubles and the resultant cost of upkeep.

Modern practice has discarded the antiquated countershaft for the simplicity and efficiency of the clutch drive direct from lineshaft.

**Adopt the Johnston Lineshaft Drive**

The economical, efficient and durable method of power transmission through friction control.

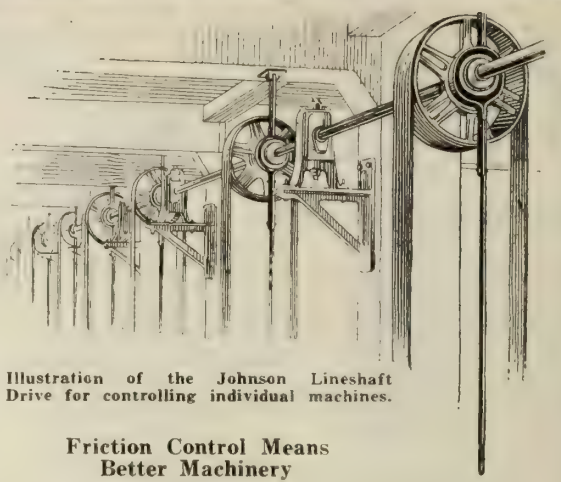

Illustration of the Johnson Lineshaft Drive for controlling individual machines.

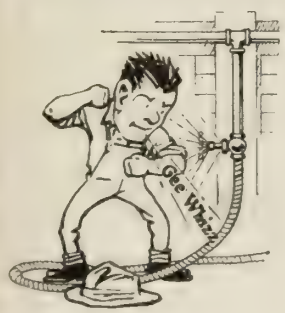
**Friction Control Means Better Machinery**



Whether it is applied overhead or in the machine itself.

Write for our Booklet "Clutches as Applied to Machine Building" and our Yellow Catalog.

Jim

# *Do Your Air Valves Leak?*

**Well!** Go into your shop when the power is shut off and you will hear leaks at every valve.

**Jim Says:—Gee Whiz:** They are all leakin'—there ain't a Valve in the shop but what is spurtin' air, and ye can't stop 'em—the compressor's workin' overtime and the coal pile is meltin' like a snow ball in June. **Every leak is an extra load on your Compressor, an added pull on your "Coal pile" and a steady drain on your "Cash box."**

**Put your "Valve Troubles" up to us—Listen!**

**Bill says:**—"Leaks," there ain't none; we stopped 'em all with **Cleco Valves**—they are all over the shop now—we don't have to waste time patchin' leaky valves, you bet."

**Ask us for a sample valve** and test it until you are satisfied—then buy some; you can't lose.

**Cleco Air-Valves** are pressure-seated—the air pressure is always on the large end of "Plug," holding it firmly on seat. No packing or springs used, the air never comes in contact with the seat, therefore no seats to replace—or springs to renew.

**Cleco Valves** improve with use—they require no attention after installation.

Bulletin 48 illustrates and describes our complete line of Air Valves and Hose Fittings. Mailed on request.

Bill

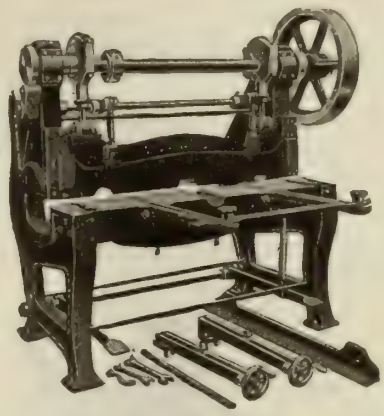
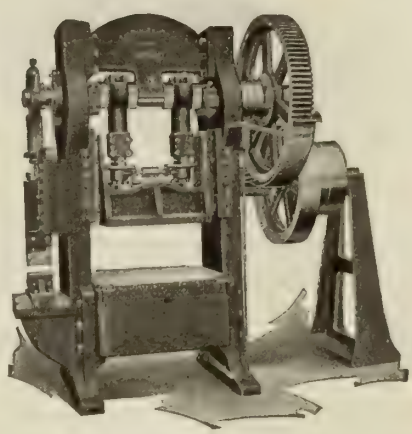
# BROWN-BOGGS

B B



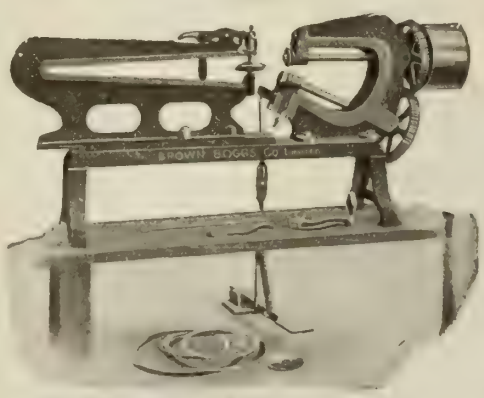
## Stands up under the excessive stress of actual service

It is not sufficient that a machine be speedy and accurate on a short trial run—it must be fast, accurate, and able to withstand the excessive stress of actual service. The losses of break-downs cannot be made up by "spurts" of efficiency.



"B-B" Tools, by their dependable, year-in and year-out service, have gained an enviable reputation for "standing the gaff."

The "B-B" line comprises tinsmiths' tools and sheet metal working machines of every description; canners' and evaporators' machinery, shears of all kinds, power presses for punching, forming, embossing, blanking, etc.



**Specify "Brown-Boggs" and you are assured of long, efficient service.**

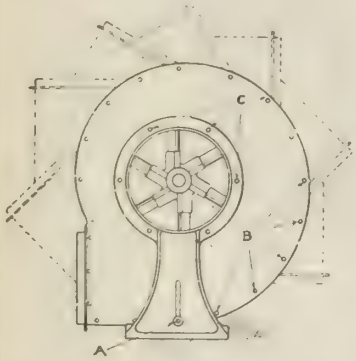
# THE BROWN-BOGGS CO. LIMITED

## HAMILTON, CANADA.

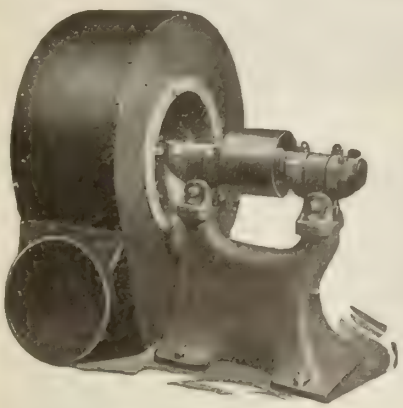
# Canadian



The Canadian Standard Reversible Mill Exhauster will keep your shop clean, remove sawdust, shavings, fumes, gas or any loose materials and disagreeable odors.

Insurance rates can be reduced; floors and machines covered with sawdust, chips or shavings, increase the fire risk.

Insurance companies reduce the premiums where adequate precautions have been taken to prevent fires.



Blast Wheel — This wheel is so constructed that it will handle any kind of stringy material efficiently, such as sawdust, shavings, cotton lint. Will also handle gases, fumes, smoke, etc.

The Canadian Standard Planing Mill Exhausters have reversible housings so that the outlet can be adjusted instantly to any angle desired.

This eliminates necessity of crossed belts. Simplifies changes on alterations in piping or building.

The housing is of heavy rolled steel plate securely bolted together with angle irons. Round cast iron outlet bolted to the housing. Blast wheel mounted on heavy cast iron spider.

Every fan carefully tested by running test at speeds in excess of that required.

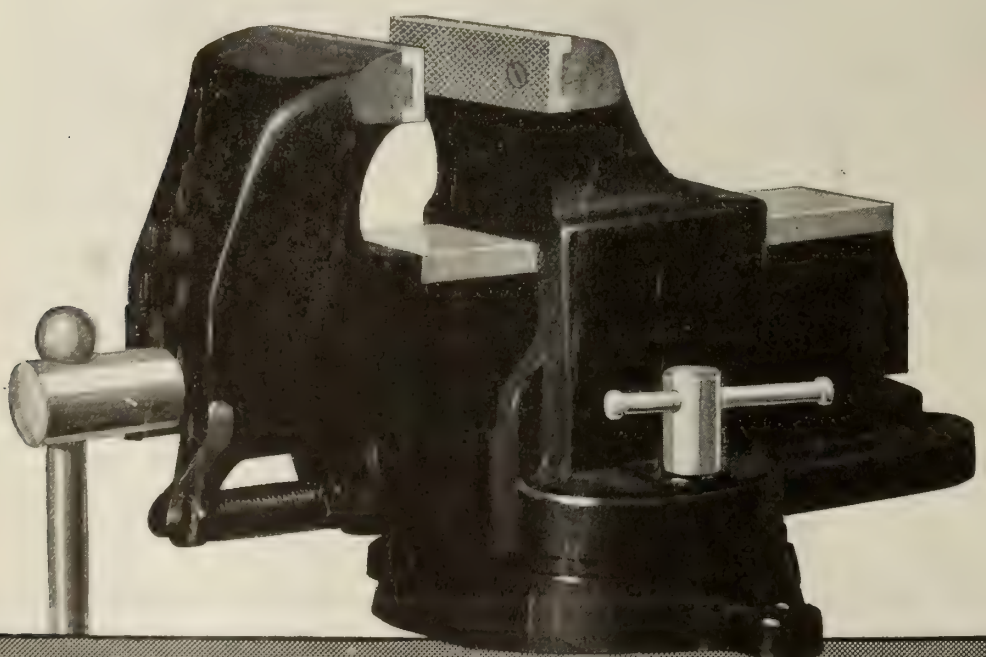
# 30 Times Faster Than Ordinary Vises

THIS Columbian Quick-Acting Vise, with a jaw opening of 6 inches, can be opened the full length of the screw in ½ of a second. It takes 30 *times as long* to rotate the handle and open an ordinary vise of the same size.

This new vise is an addition to the many other types of machinists' vises already included in the Columbian line. It is extremely simple, there are no complicated parts to get out of adjustment. A slight pressure of the trigger with the forefinger releases the screw and allows the beam to slide freely in either direction. Made in stationary and swivel base types; 7 sizes from 3 to 7-inch jaws, opening from 4½ to 12 inches. The jaw faces are removable and may be replaced with specially shaped jaw faces.

The new Quick-Acting Vise, however, is a highly specialized vise designed for machine shops in which a great many similar pieces pass continuously through the same operation. On such work as this, in an accurately timed test, an operation requiring two settings in the vise was done in an ordinary vise in 24 seconds. With a Columbian Quick-Acting Vise the same operation was done in 15 seconds.

This is a saving of 37½%!



Like all Columbian machinists' vises this Quick-Acting Vise is made of malleable iron and is twice as strong as any cast iron vise of the same rating. The famous Columbian Sledge-Test proves this conclusively.

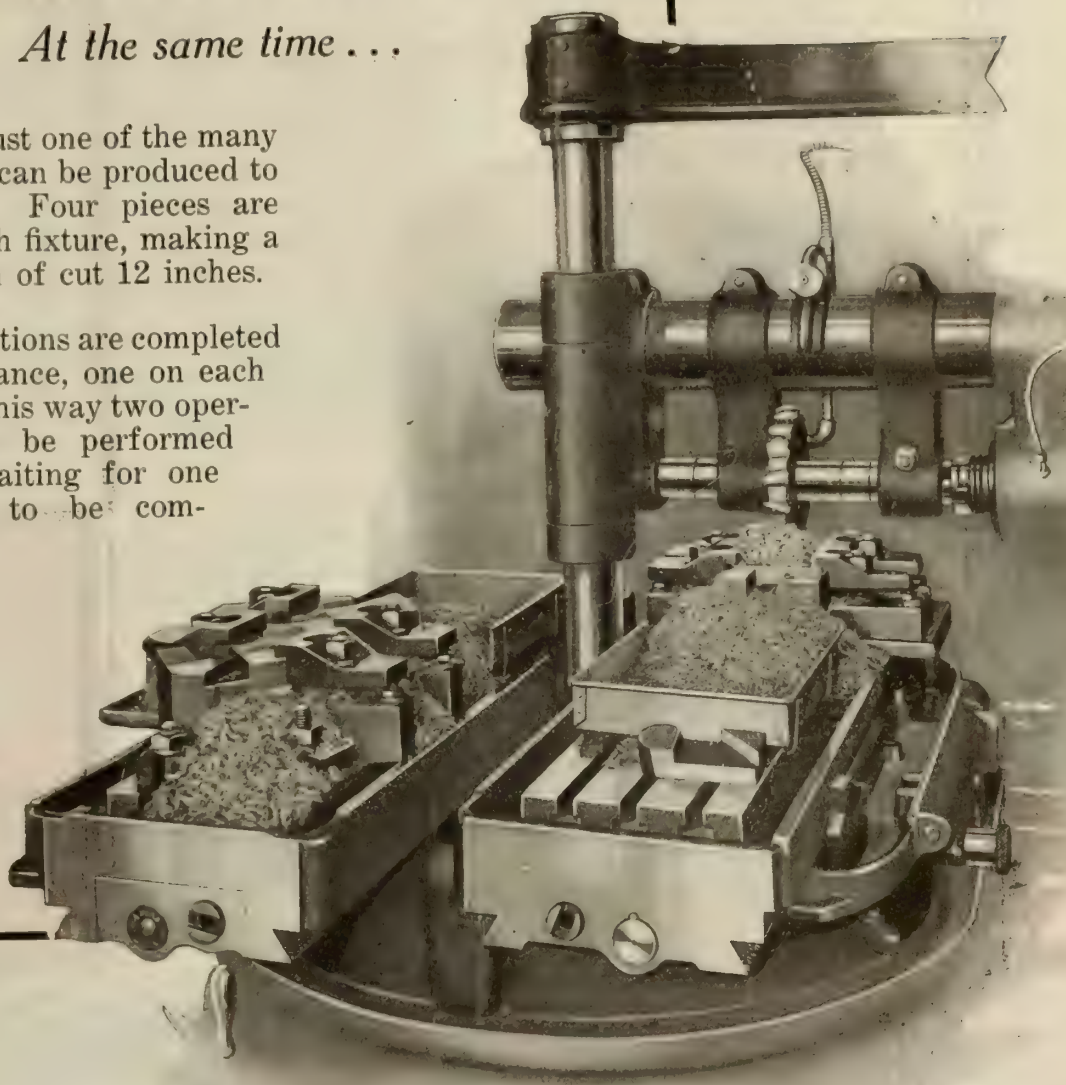
Sledge-Tested VISES

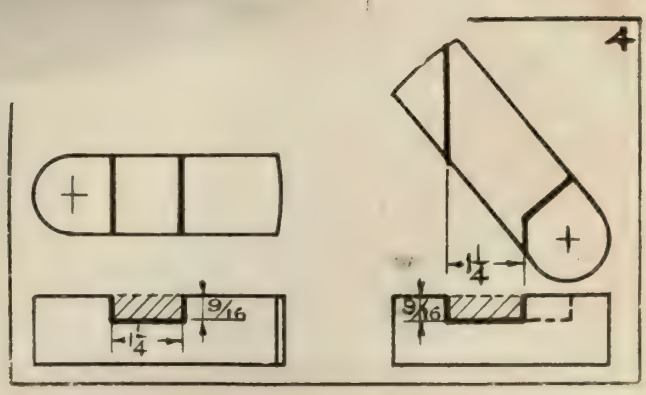


*If what you need is not advertised, consult our Buyers' Directory and write advertisers listed under proper heading.*

# Two Operations

*At the same time . . .*

Here is just one of the many pieces that can be produced to advantage. Four pieces are held in each fixture, making a total length of cut 12 inches.



Two operations are completed in this instance, one on each table. In this way two operations can be performed without waiting for one operation to be completed.

Compare this with your work and investigate this manufacturing proposition.

No lost motion.

No marks from returning cutters.

## Full Time and Overtime

HEAVY service imposes a tremendous strain on your plant machinery. Every individual part of every unit must be properly lubricated to carry the load.

Scientific selection of your lubricating oils is every bit as important as the careful choice of mechanical units themselves.

Imperial Lubricants, backed up by Imperial Service, will solve your lubricating problems. Increased production, minimum depreciation and lowered lubricating costs surely follow.

There's a right grade of oil for every service condition; the quality is always uniform, with ample supplies conveniently available. Imperial Lubrication Engineers will gladly advise you on all lubricating problems.

*Write to 56 Church St., Toronto.*

# The "Lehmann" Improved Selective Head Lathes
(Patents Pending)

SIZES—14" to 24" SWING

On account of its simplicity of construction, great driving power and rigidity, ample range of speeds, moderate tooth travel of its gears, compact and shapely appearance, the "LEHMANN" Selective Head Engine Lathe stands to-day in a class *ahead* and *alone*. Some of the features of construction are:

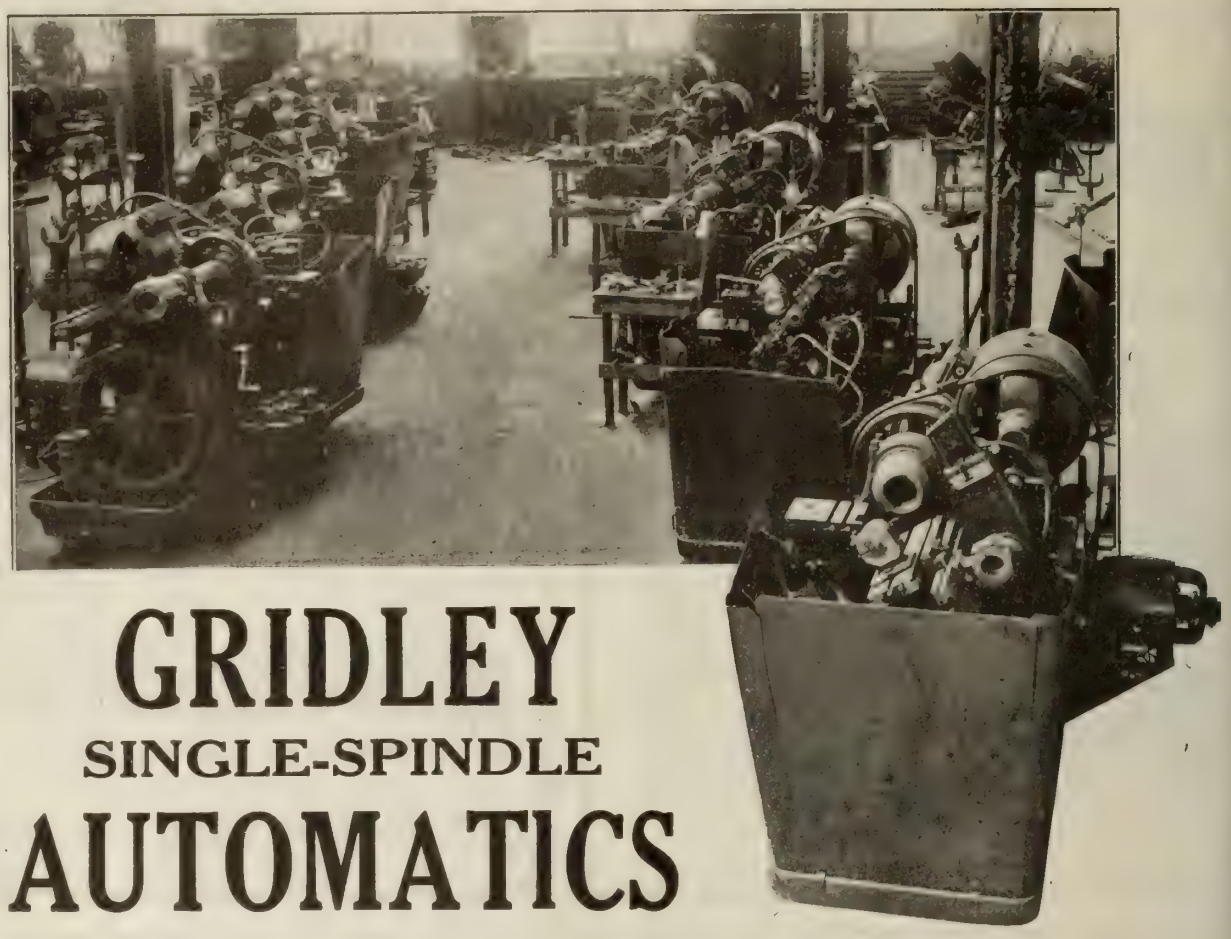
Sixteen Spindle Speeds in correct geometrical progression obtained with the use of only ten gears.

Improved Friction Clutches (Patents Pending) running in oil, requiring no adjustment and giving forward and reverse control to spindle.

Heat-treated or Hardened Steel gears.

All Shafts, except spindle, running on ball bearings.

Spindle of alloy steel, hardened and ground at the bearings and running in phosphor bronze boxes.



Head Casting forms oil-tight case enclosing all running parts.

In addition these lathes embody all features such as the patent quick change mechanism, the tailstock spindle locking device, the rod and screw shift, etc., forming part of the "LEHMANN" Cone Head Lathes which have acquired an enviable reputation for accuracy and production.

*Let us describe more fully this Exceptional Lathe and its Distinctive Advantages*

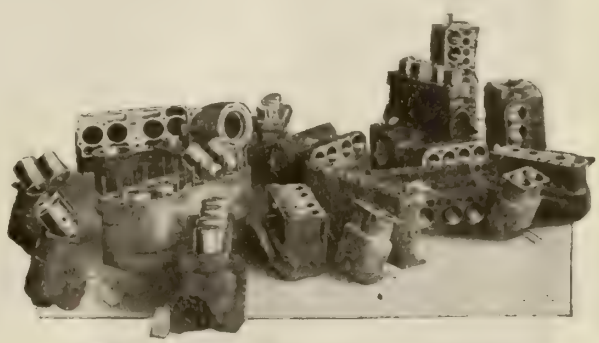
HEALD

# New Business Possibilities

A real re-grinding machine. See how easily it handles a six-cylinder en bloc.

## Regrinding Cylinders

*Saves Gas*
*Saves Oil*
*Gives More Power*
*Stops Smoking*
*Owners Demand It*



Whether you are already interested in automobile repairing or are seeking some profitable business to go into, be sure to consider the regrinding of motor cylinders.

Here is a new field of opportunity that has been barely scratched. With some thousands of registered cars that are being overhauled and whose worn and scored cylinders will require regrinding to bring back the original power, pep and economy of a new car, the possibilities are unequaled in any other business at the present time.

The Heald Style No. 55 has been just put on the market for this work. The capacity and range is such that it will handle all sizes and styles of cylinders usually found in the regrinding shop. It can be bought at a fair price, easy to set up, simple to run and maintain, with a capacity that will give you jobs you never planned on.

**Some one in your vicinity is going to buy a Heald and get the cream of a profitable business.**

**Are you the one?**

Handles all sizes and shapes of cylinders.

# LINCOLN ARC WELDER

# I SAVED!

## —from the Scrap Heap

THOUSANDS of new castings, forgings, stampings are saved from the scrap heap daily by the Lincoln Arc Welder, which fills in the defects, cracks or machining errors with molten steel, leaving a piece which will machine just as readily, look just as well, and stand up in service just as well as the piece which came perfect from the mould or die.

Let a Lincoln welding engineer visit and inspect your plant. If you make or use products of iron and steel this man can probably show you ways in which arc welding will profit you. Let us further point out that we are the only company in Canada selling electric welding equipment that also operates an electric welding shop for repair work.

In this shop, through which more than 1,100 jobs of every description have passed, we have been able to originate and develop an electrode known as Kathode Welding Wire—something that every maintenance man, every owner of an electric welder should know about. Kathode Welding Wire is made in three grades suitable for steel welding and the welding of cast iron without preheating.

These features a Lincoln engineer will be glad to explain, frankly and fully, and entirely without obligation.

*It will pay you to send for him, or if you just want our interesting welding data, simply send for it on your business letterhead to-day.*

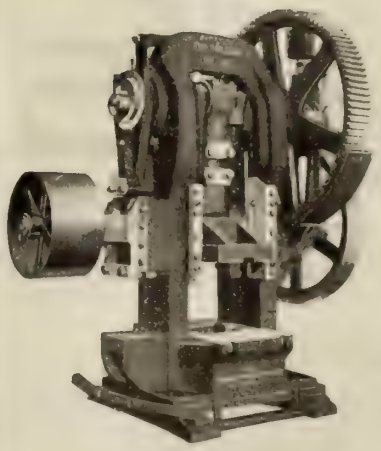
# IMPERIAL CARBIDE

**For Welding Cutting and Lighting**

HIGHEST GAS YIELD IMPERIAL CARBIDE MADE IN CANADA

It insures **effectiveness** and **economy** by **invariably** producing acetylene gas of **unusual purity.**



**Manufactured by**

**Union Carbide Co. of Canada, Ltd.**

**WELLAND, ONTARIO**

**Large Stocks maintained at convenient distributing centres throughout Canada**

## The "TOLEDO"

**Straight Column Presses**

With outer trimming slide these presses are especially adapted to work in drop-forging plants for trimming drop-forgings, hot or cold.

Their dependability on heavy work, low upkeep cost, accuracy and general operating efficiency, wins the admiration of all who use them.

Built in 70 sizes, weighing from 3,000 to 450,000 lbs.

We make a specialty of building presses to suit individual needs.

# Alundum As An Abrasive And a Few of Its Applications

## 1. Norton Alundum Grinding Wheels

(a) For the cleaning room in the Steel and Annealed Malleable Iron Foundry—on Floor and Swing Frame Grinders.

(b) For the Drop Forge Shop—for finishing the forgings.

(c) For the Tool Room on all tool and cutter grinding, taps, drills, dies, etc.

(d) For the Machine Shop—general purpose wheels.

(e) For the Steel Mill—for grinding billets.

(f) For the Automobile Factory—Alundum wheels are suited for practically all the grinding jobs.

(g) For the Automobile Repair Shop—for general work.

(h) For the Farm Machinery Shop.

(i) For the Saw and Knife Shop—sharpening all classes of saws and machine knives.

## 2. Norton Alundum Polishing Grain

Alundum properly set up with glue to the polishing wheel or belt will give you maximum production per set up on all metals.

## 3. Norton Alundum Floor Tile and Stair Tread

(a) Will last indefinitely.

(b) Always slip-proof.

All Norton Alundum products for work listed under these three classifications can be furnished from Hamilton, Ontario. Ask for literature or any specific information you may desire on your abrasive problems.

# Broaching as a Production Factor

Spline broaching—keyway cutting — broaching motor frame — internal gear cutting — broaching vise jaw— broaching key slots in locks, and other interesting work.

*By J. H. Moore*

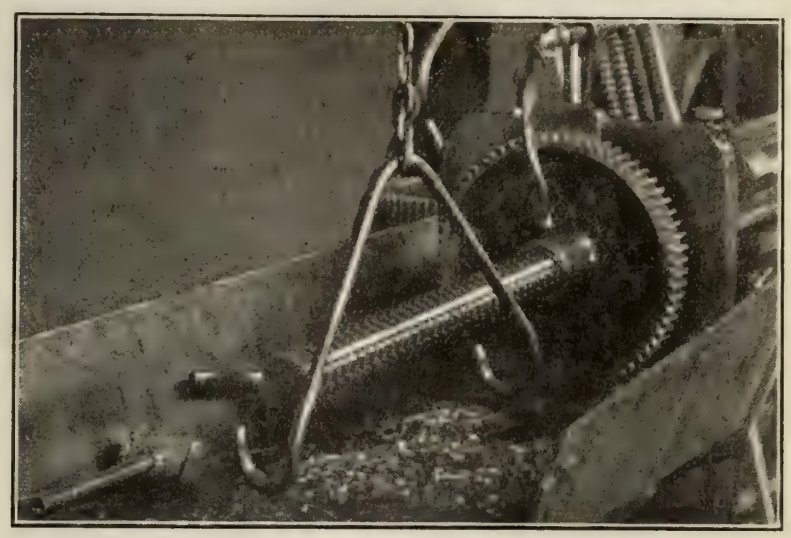

FIG. 1---AN EXAMPLE OF SPLINE BROACHING

WHAT is broaching, The average mechanic might not ask this question, but the apprentice would be almost sure to raise the point, for, if he is the right type of apprentice, he is always seeking knowledge. This does not mean that the average mechanic, or even superintendent, understands fully the scope of broaching, but in their exalted position, as the poet would put it, they leave the simple questions to the apprentice. For the benefit of those interested, here is one way in which the art of broaching might be defined.

"Broaching is the art of finishing of holes, slots and openings, or the machining of various surfaces by tools which have a series of successive cutting teeth of increasing size. This definition holds good whether such teeth are arranged singly or in multiple."

Contrary to a somewhat general impression, broaching is not a new art. As far back as the twelfth century we have record of broaching being accomplished, but, of course, the method was extremely crude. In those days they drove a suitably shaped tool through the hole by repeated blows of a heavy hammer, and it was not until about 1901 that any decided progress in the art was made.

At that time J. H. Lapointe conceived the idea of applying this principle of cutting metal, but along modern lines. The result was the designing of power-driven machinery for pulling scientifically constructed broaches through the work. Of course, all this development work took time. Mr. Lapointe then organized a company to engage in the building of such machines, also the broaches for the same. In 1911, however, he severed his connection with the firm and organized the J. H. Lapointe Co. at New London, Conn. It is to this latter firm that we are indebted for the illustrations and information to follow.

### A Talk on Broaches

At first, broaching was considered merely as a means of finishing various shaped openings quickly. But subsequent experience proved that it can also be used successfully for finishing the outside surfaces of work. Where a hole is to be broached, the work is held stationary and the broach pulled through it, but where the outside surface is to be broached, the hollow type of broach used for such purposes is held in a fixed position and the work pulled through the tool.

The broaches themselves are formed to a taper, that is, each tooth is progressively higher than the one preceding it. In this way, the edge of each tooth is able to take its share of the complete cut. The degree of taper of the broach, which is usually expressed in inches per tooth, varies according to the nature of the work to be broached, the length of the piece, and the style of machine on which the work is being done. The average taper per tooth is about .003 inch.

The style of broach used is very important. For example: in some cases it is highly desirable to nick the teeth of the broach, in this way assisting in breaking the chips. The amount of undercut on the teeth is often modified to insure a smooth cutting action, and so on. In fact, experience is a great teacher, and when in doubt it is good practice to put your problem up to the makers of the machine.

At the end of the tapered section of the broach, it is the usual practice to have about five or six teeth which are of the same height. Of course, the purpose of this is self evident, viz., to finish the surface that was roughed out by the last tooth on the tapered section.

As a general rule, the cross section of the broach is made the same shape and size as the outline of the piece to be broached, but in cases where the operation is extremely difficult, it is found advisable to use two or more broaches successfully. In fact, as many as a dozen broaches have been known to be used in some cases.

What work can be accomplished on such machines? To answer this question in detail is almost impossible in an article of this nature. Enough to say that there are some classes of work where broaching has proved very suc-

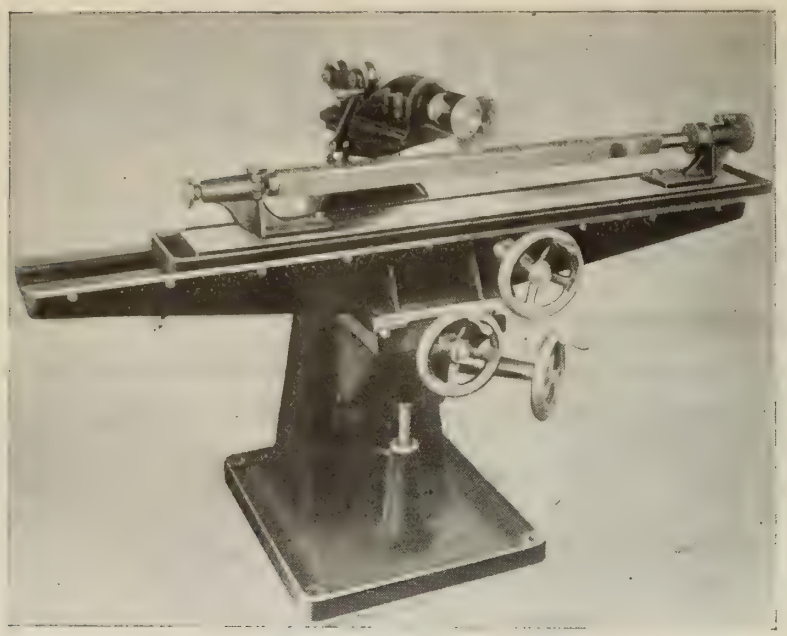

FIG. 2—THIS MACHINE WAS DESIGNED EXPRESSLY FOR THE PURPOSE OF SHARPENING BROACHES.

cessful. First let us consider internal work.

The cutting of keyways of all kinds; broaching of round, square and other special shaped openings; reamer broaching; wrenches; internal gears; grooves in various styles of work; splines; implement parts, and in fact any style of work that has a hole in it to be finished. The big point to keep in mind is productive time. Think of your present method, see if broaching can improve it, then use your own judgment.

Finishing external surfaces is, of course, the reverse operation, for, as explained previously, the broach in this case is stationary. However, it can be generally stated that former milling operations have lent themselves to this style of broaching, and serrated rolls on textile machinery have also been successfully finished by this method. However, as a general proposition, it is not feasible to make either internal or external broaches over six inches diameter.

### Is Broaching Accurate?

The accuracy secured by broaching is largely dependent upon the amount of support furnished by the surrounding walls of metal at the points where broaching is being done. In any case of cutting of metal, there is always a tendency for the work to spring away from the tool unless it is prevented from so doing by some rigid means of support. The same condition holds good in broaching. The amount of distortion is often negligible, and in many cases too small to be of importance, but it is easily understood that the highest degree of accuracy cannot be expected, or obtained, if the support around the part being broached is not adequate. It has been proved, however, that where the work, or the work holding fixture, affords the correct amount of support, the work can be held to limits ranging from .001 to .002 inch, and a broach will cut several thousand pieces before it becomes worn enough to change results.

As conditions differ considerably in the cutting of various types of metals, it is necessary to use different coolants, or, as they are sometimes called, lubricants, in order to prevent excessive heating of the broach and work. The coolant also acts as a lubricant and helps to overcome frictional resistance and consequent wear. Cast iron and brass can generally be broached dry, and in some cases aluminum is also cut dry, although many claim that kerosene should be used as a coolant.

On steel of ordinary hardness, mineral lard oil is used, this giving a combined action of cooling and lubricating. On particularly tough work, such as alloy steel, etc., white lead slightly thinned with linseed oil or kerosene is generally used.

The No. 5 machine, as made by the concern we are speaking of, has a stroke of 96 inches, so it will be seen that considerable length of work can be accommodated. The No. 0 machine has a stroke of 21 inches. These figures will give readers some idea of the range. Experience has shown that when the heat treatment of steel has been conducted to give the maximum degree of softness, the best broaching results can be obtained. A scleroscope hardness of 32 to 40 is about right, for if the metal is any softer, it will tend to tear instead of cutting freely. On the other hand, steel of a greater degree of hardness than 40 will soon destroy the broaches.

### Sharpening of Broaches

It is a matter of great importance to design the broach teeth in such a way that the cutting edges can be re-sharpened without reducing the diameter or size of the tool. This condition is obtained by leaving a land on the top of each tooth, so that when the cutting edges of the teeth become dull the front face of the same can be ground without affecting their size. It will be remembered that we have already mentioned that the last five teeth were of uniform size. As the sharpening continues from time to time, a point is finally reached when the height of the teeth begins to decrease with further grinding. The method adopted is next to start on the first of the five straight teeth, grinding this tooth so that it actually becomes the last one on the tapered section. By continuing this practice, the number of straight teeth is gradually reduced to one. When the land of this tooth has been ground away the broach has served its purpose.

However, the grinding of broach teeth is not such a task as it was formerly, for the company mentioned has produced a grinder as shown at Fig. 2, expressly for the grinding of broaches. It was originally designed for use in their own factory, but the demand became so insistent for a machine that would accu-

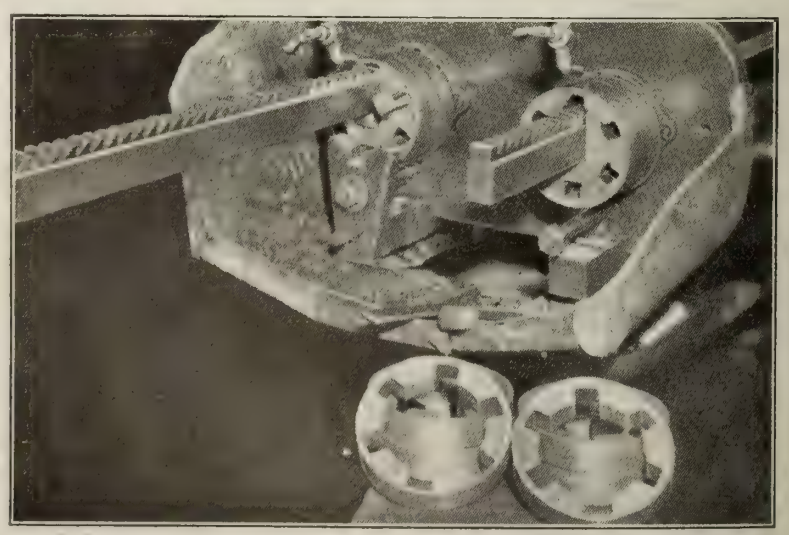

FIG. 3.—A DOUBLE BROACHING MACHINE CUTTING 216 SLOTS PER DAY.

rately grind the small and varying angles of broach teeth, that they issued it to the trade. As will be noted, it consists of a solid column supporting a vertically adjustable knee.

### The Making of Broaches.

It is an open question whether manufacturers should attempt to make their own broaches. Some corners do so, while others order direct from the makers of broaches and broaching machines. Personally, my opinion is that it pays to get your broaches made by those who understand the subject best. On one occasion I remember disassembling a large clock for cleaning. After re-assembly I had various parts left over. The clock still goes—but not as good as it used to. The same applies to broaches. You may make a broach that will do the job, but are you getting 100 per cent. efficiency out of it? However, we are not going to enter into a discussion on the subject, so let us proceed to actual examples of work performed.

### Examples of Work.

First let us consider Fig 1. Here is shown an example of spline broaching. The production on such work varies, of course, with the length and depth of cut, and it is often necessary to use a set of broaches to attain the desired depth. In this case a set of four six-spline broaches were used and the production obtained was ten finished pieces per hour.

The next example, Fig. 3, shows a double broaching machine working in a large factory at Philadelphia. The work being done is the cutting of keyways in female parts for alignment joints. Each part has six slots, and the production obtained is 216 slots per day. It might be well to mention that this output exceeded that obtained on a single machine by 80 per cent. These figures need no comment, as the significance is very clear.

Fig. 4 shows a real sized broaching job. This is accomplished on the No. 5 machine, and the operation shown is the broaching of 12 ⅝ in. by 14 in. grooves in a motor frame. These frames are 22-inch diameter, and through the use of 12 cutter bars, the twelve grooves are cut at one operation, the time per piece being only five minutes. The outer ends of the cutter bars are connected by means of radial springs that draw them to a common centre. The rear ends of the bars are cut away on the inside, so that, when the draw head is out ready for the return stroke, the cutters are drawn in toward the centre, clear of the work, which can then be easily slipped on or off the work holder or bushing on the faceplate.

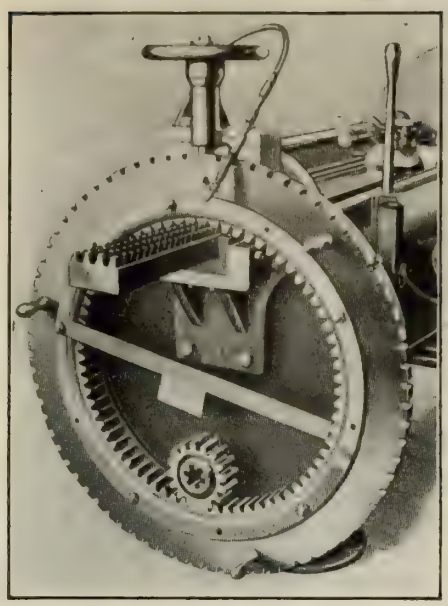

FIG. 5—A GOOD EXAMPLE OF INTERNAL GEAR CUTTING, USING A SPECIAL BROACH FOR THE WORK.

Fig. 5 depicts a fine example of internal gear cutting. This illustration shows a 22 in. gear, 3 pitch being broached. This job, although large, is completed on a No. 4 machine and, although the broaches and fixtures were rather expensive, the production obtained offset the first cost. On smaller work of this nature it is not only possible to broach all the teeth in one operation, but when the cut is comparatively short, two or three gears can be broached at one time. Of course, under such conditions, production soars, and in every case the gears are interchangeable. In a certain Detroit automobile factory internal gears 3½ in. pitch diameter, 1 in. thick, and made from 45 pt. carbon steel, are being broached at the rate of 12 per hour. This is only one case, but the production figures speak for themselves.

Fig. 6 presents an interesting piece of work. This shows a vise jaw weighing 90 pounds and having a hole 6x4½ inches to be broached. The weight of the broach used for this work is 265 pounds, and owing to its weight it is arranged with a shank on the rear end, which telescopes into a special rear bracket as shown. This bracket is securely fastened to the table, so that when the broach is disconnected from the machine it is supported in the bracket and can be rotated to clean out the chips.

After the vise jaw is slipped on the end of the broach for the operation, the machine is reversed, bringing the connecting bushing into the broach. The broach is then connected by means of a key, and the machine started for the operation. Before the shank leaves the support bracket the pressure is sufficient to hold the broach in position without the aid of the bracket. This work was done on a No. 4 machine.

Figs. 7 and 8 show two interesting jobs. The first of these illustrates the broaching of the tee slot in the breach of a U. S. naval one-pounder rifle. A set of ten broaches are used to complete the slot, and a production of one gun every hour and a half is obtained.

Fig. 8 depicts a former milling operation, that of broaching flats on a large shaft. The style of fixture used is self evident. Enough to say the work is being handled very successfully, although we have no production figures on this piece.

Let us next dwell on a few word pictures of production procured by the broaching method. On a double screw machine, connecting rods have been produced at the rate of 55 to 75 per hour, depending upon size, length of part to be broached, material, etc. In fact, with some arrangements, 100 per hour has been obtained, and as many as 20,000

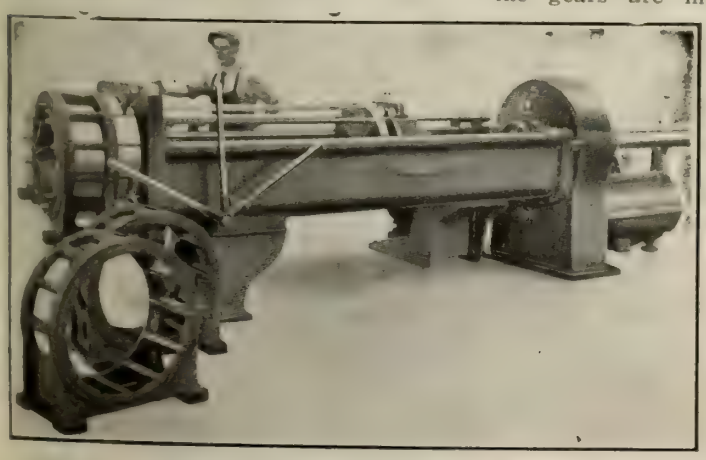

FIG. 4—BROACHING 12 SLOTS IN A MOTOR FRAME.

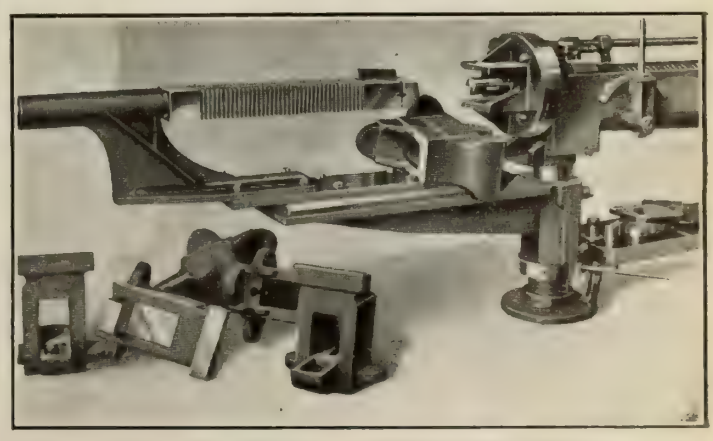

FIG. 6—BROACHING A 90-POUND VISE JAW.

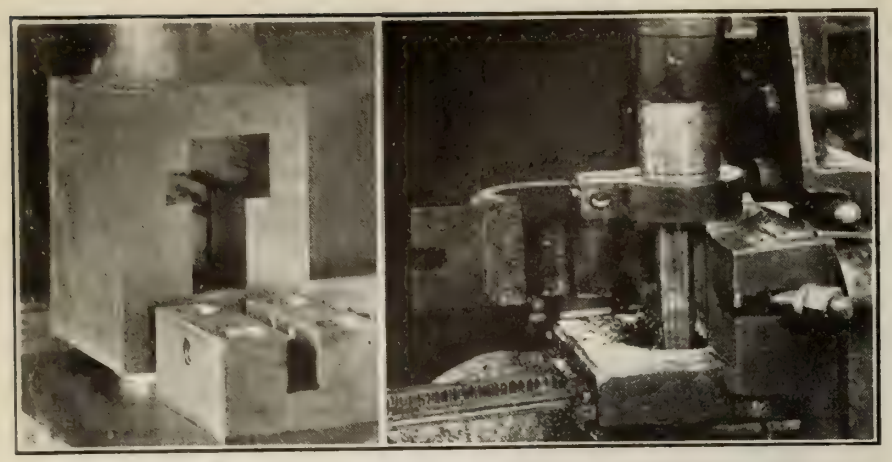

FIG. 7—LEFT HAND VIEW. BROACHING TEE SLOT IN NAVAL RIFLE.
FIG. 8—RIGHT HAND VIEW. BROACHING A FORMER MILLING OPERATION.

rods have been broached complete with one set of tools. The low cost under such conditions is readily understood.

In some plants, wrenches are being broached at the rate of 120 per hour, this figure being obtained easily, and with a very simple work-holding fixture. Automobile engine castings have also been broached very successfully; in fact, it is practically impossible to mention all the classes of work that can be broached, for new uses are being found every day.

At Fig. 9 is shown an interesting example of wrench broaching. These wrenches are broached from the rough forging, and the fixture holds eight pieces, these being all completed at one stroke. Stock to the amount of .062 in. is removed from the three jaw faces in this operation. The fixture consists of a profile projecting from a body casting to take the thrust of the broach and hold the wrenches in place. The wrench forgings, four to a side, bear against each other and are held toward the handle at each side of the fixture by two grooved sections, of which the upper is raised and lowered by a hand screw to permit the removal and the injection of the work. The broach rides in a guide and has its shanks milled away so that it is unnecessary to remove it when loading the fixture between cuts.

Allowing the machine operator as much as fifty-five seconds to unload and then put the eight new forgings in place —which is considerably more time than is consumed in actual practice—a production of 250 completed forgings is attained per hour on the single spindle machine for which the fixture was originally designed. The previous method of machining these forgings was by milling. It is claimed that the broaching method gives a considerable increase in production over milling, and that the desired accuracy is consistently maintained.

Fig. 10 depicts a lock broaching problem, and this concern gives us the following data relative to it.

**Broaching Key Slots in Locks.**

Broaching of the paracentric slots in lock plugs similar to those illustrated in the drawing is by no means a new machine shop operation. It was being successfully done at least a decade ago with vertical or push broaching machines, and before then, in one shop at least, with a rude make-shift, consisting simply of a belt travelling over pulleys to which the thin broaches were secured. But until now this rather unusual type of broaching has never been done on a horizontal or pull broaching machine.

The machine used, which is a special model of the Lapointe standard No. 1 machine, was recently built for one of the largest lock manufacturers in America. A second machine with full equipment for broaching key-recesses is now under construction for another lock manufacturer. The first of these two machines was guaranteed to broach a minimum of 100 locks per hour. This production has been easily maintained, and in fact we can now guarantee a production of 150 locks per hour on similar work. It is believed that this is considerably in excess of any previous output per man per hour.

Since, in broaching these irregular slots, it is necessary to start the cut on the external surface of the work, a positive means of holding the lock plugs as well as a rigid guide and support for the broach must be provided. The fixture is designed to hold two lock plugs and so supply two finished key-recesses after every stroke of the machine. Bolted to the main casting of the fixture are right and left hand locating blocks. At the inner edges of these blocks are bored recesses which hold the barrel-shaped work. Two clamping blocks to lock the work in place slide on the first-mentioned members. An eccentric shaft carried by the projection cast on the fixture head stands between the two clamping blocks. A turn of the shaft handle squeezes the work preparatory to broaching. At the end of the cut, the handle is again turned and springs drive back the clamping blocks and replace the work for removal. The fixture projects two feet from the face of the machine as a broach guide and is supported at its extremity by a rigid leg.

**The Broach**

Because of the extremely narrow cut, which is, as indicated in the drawing, but .056 inch wide at the least point, the broach for this lock work is an unusually delicate tool. The fragility of the cutting teeth made it impossible to cut as much metal per tooth as is, customary in the ordinary broaching of the cylinder brass, of which the locks are manufactured. This greatly increases the length of the tool so that it was necessary to provide a broach 60 inches over all. The standard No. 1 machine has a stroke of but 46 inches, so a No. 1 machine bed 20 inches longer than normal was cast for this particular job.

The 60-inch strip of tool steel was cut into ten metal wafers of equal length in order to facilitate the machining of the cutting teeth. A broach body was built to carry the two series of cutter strips, each of which was securely locked in place by a taper block bolted to this tool body. Straight slots, curved

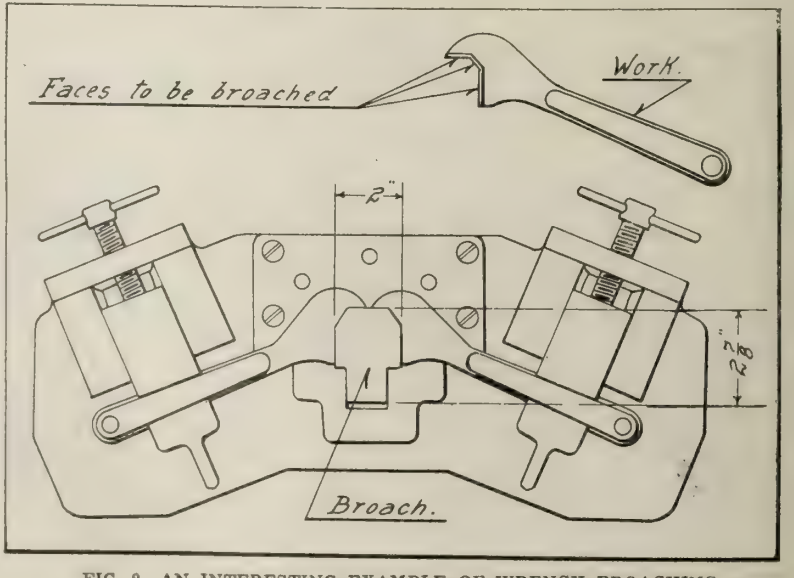

FIG. 9—AN INTERESTING EXAMPLE OF WRENCH BROACHING.

FIG. 11—TYPICAL EXAMPLES OF WORK SUITABLE FOR BROACHING.

slots, and irregular slots of any kind, except those having 90 degree or near 90 degree corners, may be broached by this method.

### Give Definite Information.

Broaching results are often handicapped by the foremen themselves, who, when desiring new broaches, write away for them, but do not include sufficient information. This condition also holds true in a more aggravated form in the case of ordering equipment for the first time, and there is no reason why executives in general should not include the information in the first place, thus avoiding delay. For example, suppose you want some cutter bars. You should then give the following information: Width of keyway; depth of keyway; diameter of hole; length of work; material to be broached; type and size machine on which tools are to be used; do you desire work bushing? what are the limits of accuracy allowed?

Suppose it is square broaches you desire, then mention the distance across flats; distance across corners; diameter of hole previous to broaching; is hole drilled or cored?; length of work; material to be broached; type of machine on which tools are to be used; whether pull bushing and guide is desired; limits of accuracy allowed, and number of pieces to be broached.

In the case of spline broaches, the last eight queries are the same, but in addition you should mention the number of splines; outside diameter of the splines, and their width. Whenever possible, include a blueprint of the piece. These instructions may seem unnecessary, but the amount of information left off the average inquiry for equipment prompts our emphasizing this point.

In conclusion, let us look at Fig. 11. Here are shown a few typical examples of work performed by broaching, and it must be considered that, after all, these are only a very few, but enough has been shown to illustrate the variety of work possible.

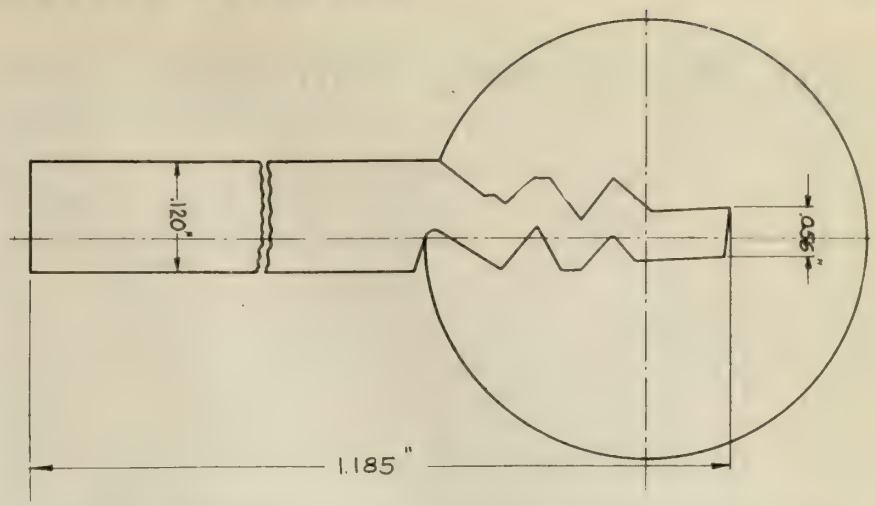

FIG. 10—SHOWING STYLE OF BROACH USED FOR THE KEY SLOT IN LOCK.

# DATA ON THE SQUARE

## RELATIVE AREAS OF THE SQUARE WITH OTHER FIGURES

Calculations based on a square of one inch on a side.

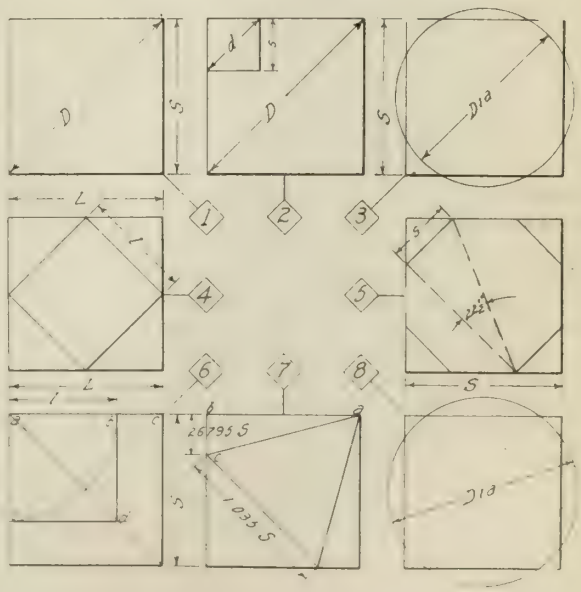
(1) A— —Area $=S^2=S \times S$. $1^2=1 \times 1=1$ sq. in.
D— —Diagonal $\sqrt{S^2+S^2}=\sqrt{1^2+1^2}=\sqrt{2}=1.4142$ in.

(2) Areas of squares vary as the squares of their sides or diagonals.
$A : a = S : S$ or $A : a = D : d$
A square 9 inches on a side is 9 times as large as one 3 inches on a side. $3^2 : 9^2 = 9 : 81 = 1 : 9$

(3) Diameter of circle of equal area.

$$\sqrt{\frac{S}{.7854}} = \sqrt{1.27324} = 1.1284 \text{ inches.}$$

(4) Length of side of square of 1/2 the area equals one-half the length of the diagonal $= \sqrt{(\frac{S}{2})^2 + (\frac{S}{2})^2} = .7071$ in.



Relative areas of squares, in the ratio of 1 : 2 may be obtained graphically as shown in (4) and (6).

(5) Length of side (s) of octagon contained in square equals tangent of 22 1/2 degrees x S = .4142 x S = .4142 in.

(7) Length of side of greatest equilateral triangle contained in square equals:—

$$\frac{\text{Tangent of 15 deg.}}{\text{Sine of 15 deg.}} = \frac{.26795 \times S}{.25882} = 1.035 \text{ S.}$$

(8) Diameter of circle, the circumference of which equals the perimeter of the square, equals: $\frac{4 \times S}{3.1416} = 1.273$ S.

# Can We Lessen Vibration and Chatter in Tool

## Chattering in Cutting Tools Can Be Avoided by Carefully Setting the Tools—Trailing Action is Thus Secured—Boring Bar Construction—Careful Tool Setting Will Assist Production

By F. HORNER

IF we take a lead pencil, hold it vertically, and draw it along the paper, as at A, Fig. 1, the result will be a harsh, chattering kind of action. But if the pencil is inclined, as seen at B, this vibratory influence will disappear, and the stroke will be smooth and sweet. This principle of setting the tip behind the centre or holding spot is applied in several types of cutting tools, and is advantageous because of the lessened vibration and chatter. It is only a question of radial movement of the point. Could everything be held perfectly rigid, including the work, the tool shank, and all the parts of the machine that hold and sustain it, the trailing action would not offer any advantage, but as there is inevitable spring and elasticity in most of the elements, the machinist has to circumvent the effects of this deflection.

Imagine our pencil directed forward, as shown at C, what happens is obvious. The resistance of the thrusting of the lead causes the body to bend, or the hand to give, and the penetration deepens, as indicated by the dotted curve. The centre, a, is represented in the case of tools by some portion which is the location of elasticity. In a planer or shaper tool box it is assumed to be the clapper-box pin for sake of demonstration, although other sources of weakness are the tool shank itself, the binding clamps, and the joints of the tool-box and saddle. Even the cross-rail i self may undergo torsion. In stri theory, therefore, the tool point oug

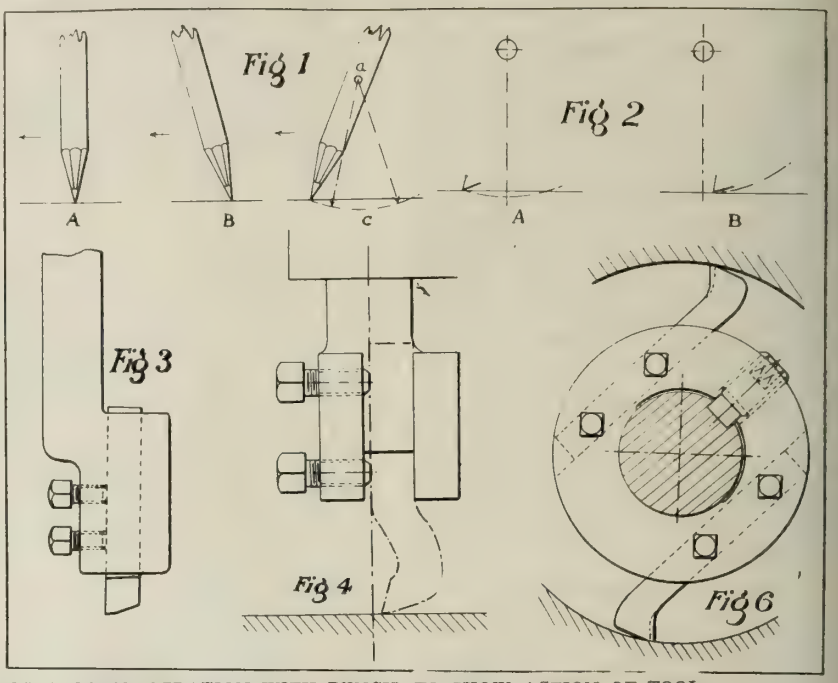

FIG. 1—DEMONSTRATION WITH PENCIL TO SHOW ACTION OF TOOL.
FIG. 2—TOOL SET BEFORE AND BEHIND PIVOT PIN.
FIG. 3—TOOL EDGE COINCIDENT WITH UNDERSIDE OF SHANK.
FIG. 4—BORING-MILL HOLDER CARRYING TOOL SLIGHTLY GOOSE-NECKED.
FIG. 6—SMALL BORING-HEAD WITH TRAILING CUTTERS. (The trailing cut.)

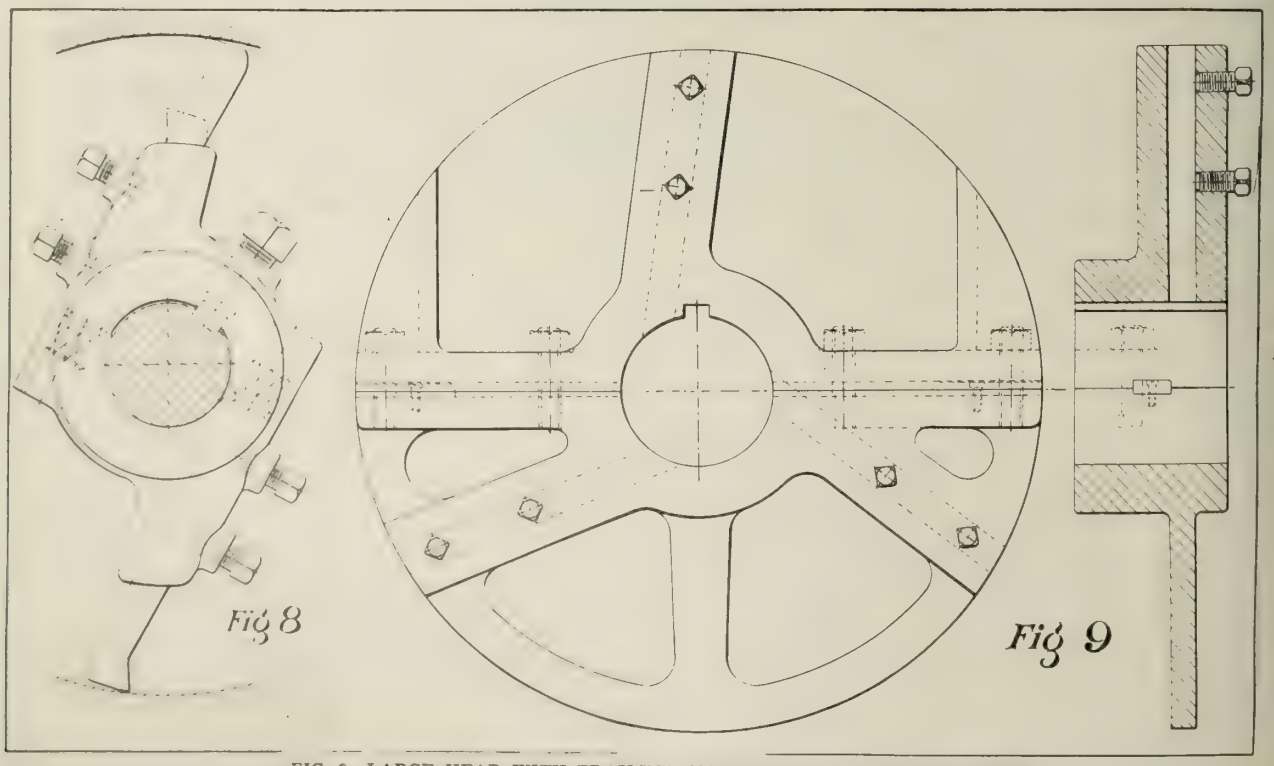

FIG. 8—LARGE HEAD WITH TRAILING CUTTERS AND END ADJUSTMENT.
FIG. 9—LARGE DISC HEAD WITH TRAILING CUTTERS.

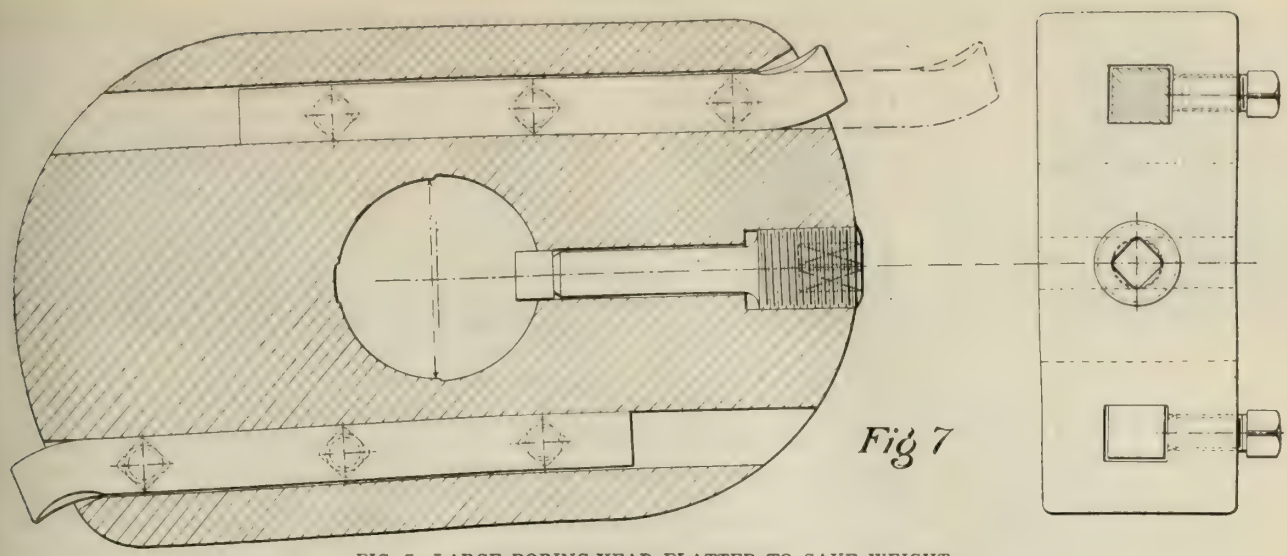

FIG. 7—LARGE BORING-HEAD FLATTED TO SAVE WEIGHT.

to lie back of all these elements, but as this is an inconvenient proposition, the pin is sometimes accepted as the pivotal centre. The tool point consequently instead of being set anywhere in front of the pin, see the diagram, Fig. 2, A, is located behind it, while B is located to a greater or lesser extent, dependent on the convenience of making and using a goose-neck solid tool or holder. This adoption of the spring principle does not necessarily imply weakness; the elasticity is there, but only for the purpose of preventing digging in, and is not comparable with the use of a spring tool of weak pattern that is employed for taking a very fine finishing cut. The only result of an attempt at heavy cutting with such a tool would be the continual evasion of cutting at every little lump or excess of metal.

An even and regular area of metal to be machined imposes little difficulty upon the tool operation, because the stress is constant and not subject to fluctuations inducing the tool edge to dip deeper at any particular spot. Such work, however, is rarely met with, as most pieces are of irregular surface, with swells and lumps, hard spots, and blowholes or other faults that cause variations in tool pressure. Hence, to relieve the machines, the tools, the work, and its fastenings of a great deal of strain and vibration, the trailing out is employed to a considerable degree, not only in planing and shaping, but in boring, and to a moderate extent in other processes.

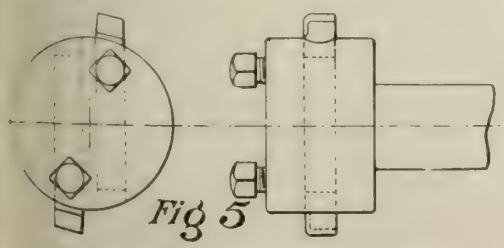

FIG. 5—BORING TOOL WITH CUTTERS BEHIND CENTRE.

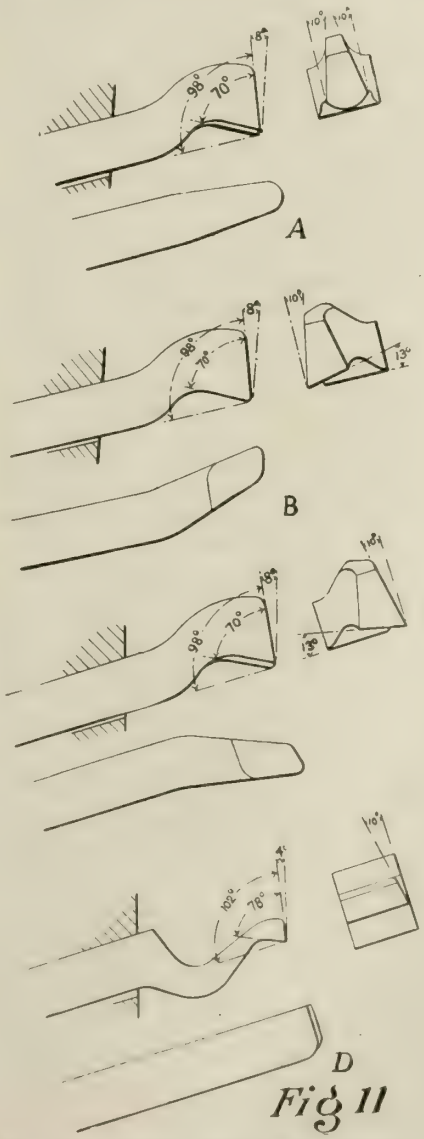
As mentioned above, the approximate point of bending is not set down as a hard and fast rule, and a very general practice in regard to planing tools is to



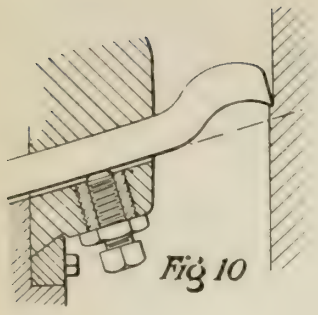


FIG. 11—STANDARD TOOLS FOR PEARN-RICHARDS MACHINE.

have the cutting edge thrown back to a distance equal to the thickness of the shank, a method that answers very well. This is also done with planing holders, such as Fig. 3, as well as with form and radius holders having flat cutters. As regards boring and turning mills, the difficulty lies in the fact that a tool must be prepared to work to the centre of the circle, hence a goose-neck shape would be inadmissible. What is done in this instance is to drop the seating of the holder back, see Fig. 4, so as to bring the face of the tool on a line with the centre. Then, if a trailing action is deemed desirable, one has only to crank a tool appropriately, more or less, such as suggested by the dotted lines in the drawing.

### Boring Bars

Boring bars, from their unsupported nature, and often undue length, are particularly subject to chattering, especially as the bores are badly cored, with irregularities, lumps, blow-holes, and sometimes ports or other openings which cause distress to the tool edges. This question is frequently a matter of relative output, for a bar with non-trailing cutters might tear through a bore in a fashion, but leave it rough and irregular with numerous digs-in. This bore would cost more to finish smooth and true than one had been machined more efficiently with trailing type cutters. The conditions vary so, however, that no hard-and-fast rules may be laid down, results depending on the strength of the bar, the hardness of the material to be bored, and the depth and regularity of cut, combined with the feed rate.

The simplest type of construction for a two-cutter bar is that represented by Fig. 5 for bars of moderate size. The head being swelled permits of sufficient metal to accommodate the two shanks side by side. A similar idea is adopted in some kinds of adjustable blade reamers and boring tools, in which the blades are expanded or contracted by a threaded collar or other medium. When

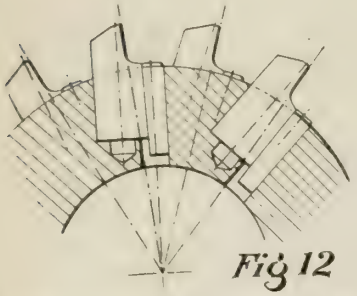

FIG. 10—ATTITUDE OF TOOL IN PEARN-RICHARDS MACHINE.
FIG. 12 MILLING-CUTTER TEETH WITH TRAILING ACTION.

a head is applied to a boring-bar and the trailing principle is desired, the cutter shanks must be disposed to pass alongside the bar, unless the head happens to be of unusual diameter. Three examples of differing designs may be noted in Figs. 6, 7 and 8. The first is suitable for diameters ranging from about 6 in. to 12 in., using heads varying from about 5 in. to 8 in.

Larger heads on this style of construction would involve unnecessary metal in the body, so lightening is done either by flatting the sides in the manner shown in Fig. 7, which provides very long life to the tools, by reason of their length, or by casting bosses on as illustrated in Fig. 8. This last design embodies adjusting screws behind the cutters, to set them and prevent slip. The top faces of the tools in these examples are ground either radial, or with top rake as required. Fig. 9 is a large disc form of head, in which the tools are set in trailing fashion. For convenience of placement and removal on the bar the head is made in halves, with a keyed and bolted joint face.

The application of the trailing cut to facing operations in the boring machines assists production, and the attainment of a good finish. In the case of the Pearn-Richards machines manufactured at Manchester (England)—on which Figs. 6 and 8 are employed—the face plate of the spindle carries a tool-holder or slide which can be fed across in either direction, propelling the tool gradually across the work face. The tool is held in the slide in the way given in Fig. 10. The formation of a few standard tools can be observed from Fig. 11, with top rake suitable for general purposes. The set comprises a straightforward tool, A, bent ones B and C, and a thin spring tool D, with wide face for the finer class of finishing.

With regard to inserted-tooth milling cutters, the conditions in these are not quite parallel with those of the tools previously considered. The amount of projection of the teeth is usually so little that the question of bending or springing hardly comes in. The endeavor to adopt the trailing action is sometimes made, with a view to securing a smoother cut, a specimen of which is offered in Fig. 12. The tooth faces are ground radial, but the tooth body is set behind the normal radial line.

## NOTES ON GAUGING

Speaking on the subject of gauging, especially in regards to the Wickman type shown in this week's new development section, the Alfred Herbert, Ltd., have the following to say:

The manufacture of various components often calls for close limits, and in spite of the increase in the employment of limit gauges to ensure interchangeability of parts, the manufacture of the necessary screws for these parts is still carried on in a haphazard and rule-of-thumb manner. The screws supplied, as will be readily understood, have usually a short life because the importance of form of thread has not been fully appreciated. When replacement screws are ordered, it is usually found that they will not fit without resort to "die-ing" down.

It would appear customary for manufacturers to set up their screw machines to components; this results in an unsatisfactory state of affairs. The component itself is a variable in that its tapped hole will vary in size between limits. The screw machines are allowed to run thus set up, until the assembly shop reports that trouble is being experienced in fitting screws in the holes. By this time the screw machine is some days ahead in production and all the screws which have been made in the interim require hand sizing.

The shape of the threads not being controlled, there is a tendency amongst automatic setters-up to use dies, which produce extremely thin threads, i.e., threads of low effective diameter, thus protracting the periods between setting up. Even if the screw becomes slightly larger on the major diameter due to wear in dies, etc., it can be forced into the hole with a screw-driver, as all the pressure is taken on the tops of the threads themselves, which, being thin, are easily crushed down.

It is not often realized that the more care that is taken by manufacturers to maintain the correct shape of the thread (a necessary condition for screws which will be a good fit and have a long useful life) the more difficult it is to maintain interchangeability. Thus one occasionally hears the argument that interchangeability threads can be produced without gauges. The thread thus produced under such conditions has the effective diameter considerably below the nominal, with a very low mechanical strength and a short useful life. Many manufacturers check their bolts or studs by a micrometer reading on the major diameter regardless of the importance of pitch or effective diameter. These screws have only to be inserted or withdrawn several times to produce a bad fit.

To remedy this state of affairs, attention is directed to the following general principles. The automatic machine should be set up to pass a standard thread gauge, preferably a gauge which will be of a limit type. The gauge itself should be periodically inspected for size, and any error due to wear of more than a predetermined amount should not be permitted, depending upon the pitch of the thread and the use to which the screw is put. The component itself should be tested by means of a plug screw gauge which should also be periodically inspected. This procedure certainly entails a new overhead charge, but the finished article will be superior in quality and will be cheaper in the long run due to elimination of fitters' work on screws. It is futile to produce screws on the machine if 50 per cent. of the output needs re-sizing later by hand.

The ring gauge has undoubtedly been a constant source of trouble to users. It labors under a number of inherent disadvantages. It is very costly to make; it is difficult to check its size when made, and the periodic inspection of it becomes a laboratory process. If the article does not screw into the ring there is no clue as to what is wrong; if it does screw in, there is no guarantee as to the kind of fit, since a ring will pass a screw of exceptionally low effective diameter (i.e., with wafer-like threads) without shake, provided the major diameter is a good fit, or due to big pitch error in the screw.

Next to accuracy of pitch the most important element of a screw is the effective diameter, which is the measure of useful life and mechanical strength. The major and core, provided the error in them is not too great, can vary to many times the limit that could be allowed on the effective diameter, and yet produce an efficient screw, if the gauging equipment is such that it will not permit the major diameter to be larger than nominal or the core shallower than nominal, and so produce interference.

From the foregoing it will be obvious that a gauge, the tolerance of which on the effective diameter can be fixed to a predetermined amount, will be a great advantage. This effective diameter must of necessity be lower than nominal. Any screwed product has an error in pitch; it would not be a commercial proposition to produce one with an error sufficiently small to be called negligible. Any particular error in pitch increases the nominal effective diameter by four times pitch error. For example, if a screw has a pitch error of plus .001 inch its effective diameter will have to be lowered by .004 inch in order to assemble in a gauge (the pitch of which would be accurate to about .0001 inch).

# WELDING AND CUTTING

## Electric Arc Welding Applied to Aluminum*

### Three Ways of Dealing With Oxidation—Current Necessary When Welding Iron or Steel—Necessity of Flux Coating and Other Points of Interest

By F. J. HEYES

EVER since the discovery of aluminium the greatest difficulty has been experienced in joining pieces of it together, either by soldering with some other metal or alloy, or by autogenous welding.

The first and greatest difficulty to be overcome is the affinity of aluminium for oxygen. In order to get any two pieces of metal to unite, it is essential that the surface should be free from any coating of solid dirt or oxide which will prevent them coming into intimate contact. The affinity is so great that even at ordinary temperatures a clean surface quickly becomes thickly coated with oxide, and at temperatures approaching its melting point it immediately becomes thickly coated, and small pieces of the metal will burn away completely. The melting point of the oxide is far above that of the metal, so that it is impossible to weld two pieces together without some flux which will dissolve or get rid of the oxide.

With a plain aluminium rod without any coating of flux, on striking the arc the metal, instead of dropping off as soon as it is melted, hangs in globules on to the end of the electrode, till they become as much as half an inch in diameter, when using a number of electrodes; they then fall on to the plate which is to be welded. These globules become thickly coated with oxide, and so does the plate, so that when they drop off they adhere to the plate only at the point where they are playing, and when cool they can be easily pulled off with the fingers. All the time that this is taking place thick clouds of fumes are given off, and eventually the pieces of aluminium which were to be welded melt, but show no signs of adhering to one another. The thick clouds of fume are probably due to the fact that some of the aluminium is vaporised by the intense heat of the arc, and burns away much more freely.

*From "Mechanical Engineer."

#### Three Methods

There are three ways of dealing with the oxidation: First, by protection of the surfaces from contact with the air and consequent oxidation, by some flux which fuses easily and will not prevent the surfaces coming together. Secondly, by solution of the infusible oxide in some fluxible substance which does not affect the quality of the weld; and thirdly, by chemical combination of the oxide to form some substance which is fusible at the temperature of melting aluminium, or a combination of these may be used.

Perfect protection of the surface cannot be obtained in practice, so that it is necessary to combine protection with solution in one form or another. Chemical combination has the disadvantage that any substance that combines with the oxide will also combine with the aluminium, and so may be used up before dissolving all the oxide, or portions of it may become embedded in the deposited metal and cause subsequent corrosion. Hence, solution of tin oxide in some solution which is chemically suitable when in contact with aluminium is the best method, if obtainable.

Chlorides of the alkaline metals are very suitable for the protection of the molten surface from contact with the air, as they melt below the melting point of aluminium and do not interfere with the making of the weld. Fluorides of the alkaline metals and of aluminium have the property of dissolving aluminium oxide without chemical combination, so that they would appear to be the most satisfactory if there were no other obstacle to their use. Bisulphates of the alkaline metals, being unsaturated compounds, can combine with the oxide, and are very useful for this purpose.

Arc welding of aluminium has been attempted by the author, using the ordinary acetylene welding fluxes, without any success whatsoever, and he reached the conclusion that it is essential to use a flux which is not easily vaporised. For this purpose he found cryolite suitable. In arc welding a small pool of molten aluminium is formed at the point being welded, the temperature of which is far above the melting point of the metal, some of the aluminium being deposited in the form of vapor. At this temperature the cryolite becomes quite fluid, and runs freely on the surface, enabling a very good weld to be made. In trying to weld with a plain electrode the aluminium hangs in globules at the end of the electrode, as already explained, and there is still a tendency for this to occur when using cryolite alone. A small percentage of chloride, however, overcomes this difficulty and renders welding easier.

#### Flux Coating

In arc welding it is essential to have a coating of flux on the outside of the electrode, as otherwise the aluminium in passing from the end of the electrode to the work becomes so thickly coated with oxide that a very large quantity of flux would be required to deal with it. Where the electrodes may be subjected to rough handling it would be very desirable to have the flux enclosed in the electrode, but as this is impossible, it becomes necessary to fix the flux on the outside of the electrode, which may be done satisfactorily with a binding of fine cotton.

In welding iron or steel a current of about 80 amperes is required for a plate about ¼ in. thick, using a No. 8 electrode, but to weld a similar sheet of aluminium satisfactorily it is necessary to use about 150 amperes. The only explanation offered for this is that aluminium is a much better conductor of heat than

(Continued on page 43)

# Tools Used in the Machining of a Roll Carrier

## Four Operations Necessary, viz.: Three Milling and One Drilling —Fixtures and Cutters Used—Advantage of Adapting Finished Surfaces as Locating Points—Simple Fixtures Are Used

By F. SCRIBER

SOME interesting tool set-ups that have been developed in connection with the manufacture of the part illustrated by Fig. 1 are described in this article. The part to be machined is made of cast brass, and a few dimensions showing its general proportions can be noted in the sketch. On account of its frail construction, it would be very easily broken if made of cast iron, so that brass was the best material, insomuch that no great strain is placed upon it, brass being sufficiently strong for the work it had to do. The piece forms a part of a textile machine for carrying two rolls, one at A and the other at B, said rolls being used to transmit motion from a cam to an oscillating arm, and the operations performed in connection with this were, first, milling across the bottom indicated as X, at the same time finishing the sides along the bottom; and second, milling inside of the large bosses A. The third operation is milling the smaller bosses B, while a fourth operation is necessary for drilling all holes in the carrier.

The fixture in which the milling of the bottom was performed is known as the gang fixture, and in it two rows of the parts are set up. The fixture is made to carry a number of parts set end to end, thus utilizing the entire capacity of the machine for what proves to be practically continuous milling. This fixture is shown in Fig. 2, while a gang of cutters used with the fixture is shown in Fig. 3, this consisting of two combined side and surface milling cutters located the correct distance apart on an arbor with spacing collars.

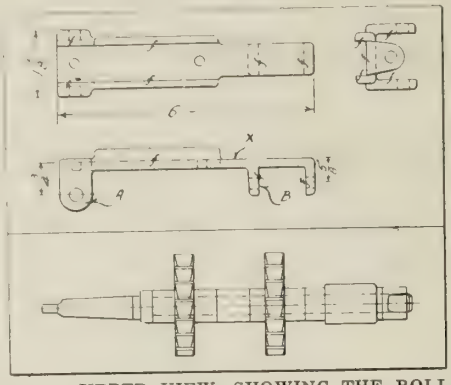

FIG. 1—UPPER VIEW, SHOWING THE ROLL CARRIER.

FIG. 3—CUTTERS USED FOR MILLING THE BOTTOMS.

Referring to Fig. 2, A is the base of fixture which is made of cast iron; the carriers are located on steel seats B, which are screwed and doweled to this base. Other steel blocks C are used to locate the work endwise, the two small bosses on the work being set over these blocks to accomplish this. Other blocks E are placed between each two pieces and against these the work is clamped sideways by means of two clamps F and G, which are caused to operate by draw bolt H when nut I is tightened, thereby drawing the two clamps together. Similar sets of parts throughout the entire length of the fixture hold other parts in place, and the fixture itself is clamped to the table of the miller (which is of the horizontal type). The operation consists of setting the work on a block, locating it endways between the bosses, and clamping it sideways against a centre block. These side-clamping members are made slightly under cut, so the tendency will be to draw the work down against its locating seats.

A rather simple fixture is shown in Fig. 4. This is used for holding two parts while the large bosses are milled inside by a side milling cutter of the correct width. In operation, two parts with the large bosses at centre of fixture are set on a steel block A and are clamped in place by a large strap B, which is forked so that the cutter can drop between it, thus milling the bosses. Nut C tightens the clamp, thereby holding both parts, and a spring D under the clamp raises the same clear off the work when the nut is loosened, thus permitting ready removal. The base of the fixture E is made of cast iron and is located in the tee slot of the milling machine by tongue F, it being obvious that advantage is taken of the finished portion, machined in the last fixture, for locating the work sideways. The vertical feed on the horizontal milling machine is used for performing this operation, the cutter being fed into the bosses the required depth, following which the table of the machine is fed horizontally, just sufficient to mill the bosses.

Again taking advantage of the finished seat on the bottom of this roll carrier, two small bosses X, Fig. 5, are next milled inside, using a cutter which will mill them the required width. This fixture has a hinged cover A, and the fixture is made to hold five parts. The base of the fixture B, which is cast iron, has a steel blank C screwed and doweled in position as shown. Five parts are

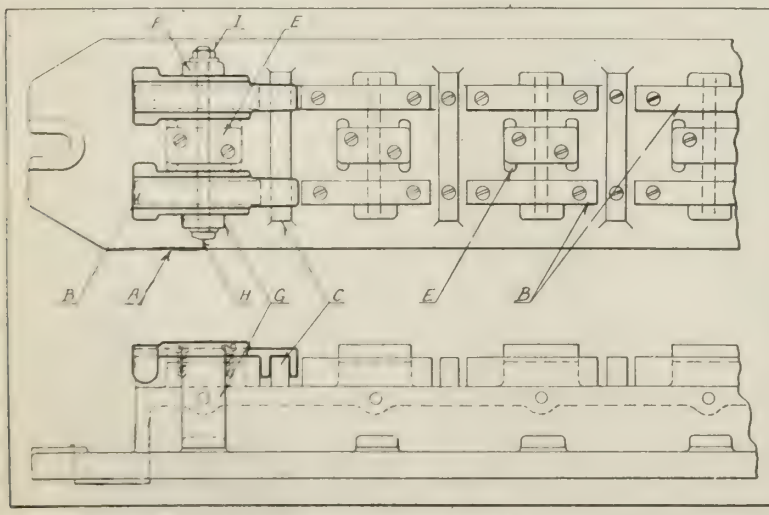

FIG. 2—FIXTURE IN WHICH BOTTOMS ARE MILLED.

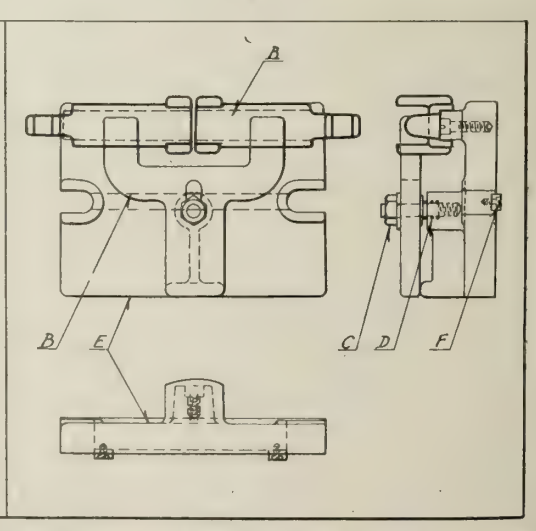

FIG. 4—FIXTURE FOR MILLING INSIDE OF LARGE BOSSES.

put on each of these blocks with the hinged cover A swung back clear of the fixture, said cover pivoting on hinged pin D. Following this, the hinged cover is swung into position as shown and is clamped by means of the hinged bolt E which carries a nut and washer; this bolt pivots on pin F. Each part is forced against the hinged cover at the side by means of set screws G locating from the outside of the bosses at X. A series of set screws H, carried in the hinged cover, clamp the work down on the steel seats. It will be seen that this arrangement permits of holding the work securely in place and locating it sideways and endways in a substantial manner while the cut is taken between the two bosses. Although the milling machine was used for this particular job, the same arrangement permits of machining on either the planer or shaper.

In the fixture shown for the first operation, Fig 2, the method of operating it is to load the first four pieces in place, after which the feed on the machine is thrown in, allowing the cutter to traverse across the work. The operator then puts other parts on for the entire length of the fixture as fast as practical and, after the fixture is completely loaded, starts to remove the pieces machined. This can be done quite conveniently, as two parts only are held by one set of clamping units; thus almost continuous operation of the machine is obtained.

The concluding illustration, Fig 6, is that of a drill jig. There are six holes to be put in this piece, one in each boss and two others in the bottom. In this jig A is made of cast iron, and carries a steel cover B, which is hinged on pin C, and is locked in place by quarter turn screw D. When putting the work in position the cover is swung clear of the jig, while the work is located on a steel block E, this block being similar to those used on the milling fixtures. The large bosses are slipped under a steel plate F, which is held to the body of the jig by screws and dowels. This plate contains a bushing G for making one hole through the bottom of the roll carrier; two bushings H and I are contained in the sides of the jig for guiding the drills which make the holes in the large bosses. A bushing J at the opposite end guides the drill that comes through the outer small bosses, while a block K is attached to the hinged cover of the jig by screws and dowels and is used for locating the work endways as well as guiding the drill through the other small bosses, the operation being to put the work in with the cover back, swing the cover over and locate the two small bosses between block K.

The hinged cover is then locked by turning the quarter turn screw D, and a set screw L carried in the cover is employed to clamp the work on the steel seat E, while the other drill guiding bushing M is contained in the cover. This jig is machined on its four sides, two ends and bottom as indicated by marks, so it will be true in the various planes from which the work must be drilled.

All of these tools are economical inasmuch as they are so simple in design. They hold the work substantially and carry at one setting a sufficient quantity of parts so that the operation keeps the operator busy while enabling him to keep the machine cutting almost continuously. In the case of the first operation, one fixture and machine was operated, and when using the second and third operation fixtures, the operator runs two machines while the drill operations, being short, require all the operator's attention.

## ELECTRIC ARC WELDING APPLIED TO ALUMINIUM

(Continued from page 41.)

iron, and as it is necessary to keep the pool of metal at the point being welded well above the melting point it is necessary to use a much higher current. When the plates being welded are cold it is impossible to weld with a smaller current, but if the work be preheated to about 400° C., a good weld may be made with about 60=80 amperes. This bears out the above explanation. As the melting point of aluminium is only 500° C., it does not require so intense a heat to keep the point being welded above this temperature if there is only about 180° C. difference between it and the surrounding portions of the material.

The welding current should increase with the thickness of the plate; for ⅛ in. thickness 120=130 amperes is required; for ¼ in., 140=150 amperes. The reason for this is that with a thick plate there is a greater area to conduct away the heat from the molten pool under the electrode than there is with a thin one. In welding a very thick plate a condition is reached where heat is conducted away from the greater part of the surface of a sphere of which the point being welded is the centre. For plates thicker than that corresponding to this condition no increase in welding current is required.

The possibility of producing a pool of metal well above the melting point at the spot being welded without heating up the whole plate to the melting point is one of the great advantages of arc welding over oxy-acetylene welding. In work which has been welded with the oyx-acetylene flame it is frequently found that the pieces have run together only on the surface, as if the operator attempts to melt the aluminium to a greater depth a large portion of the work may be melted out. This is not so likely to happen when using the electric arc, as the heating effect is much more local.

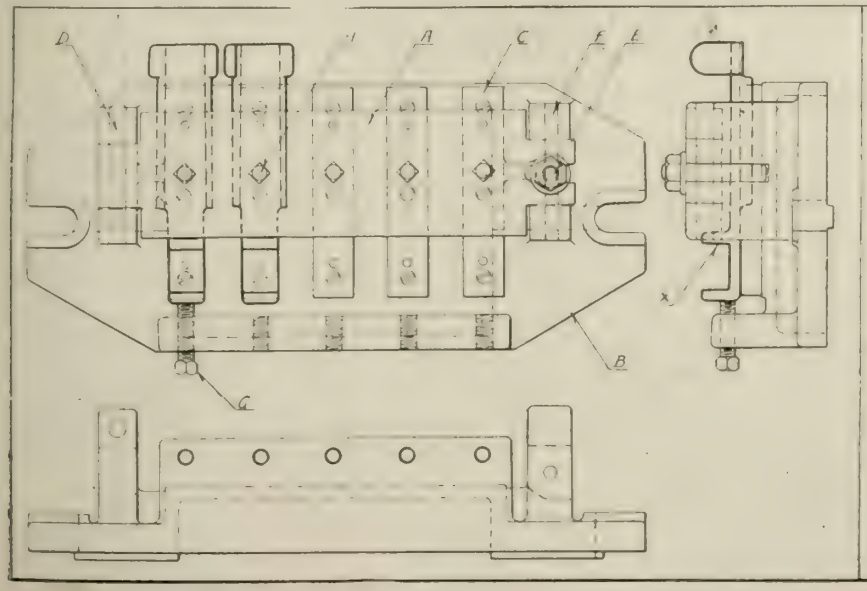

FIG. 5—FIXTURE FOR MILLING INSIDE OF SMALL BOSSES.

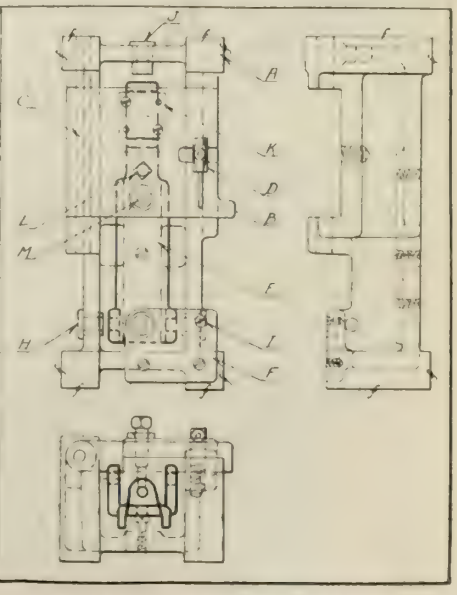

FIG. 6—DRILL JIG FOR CARRIER.

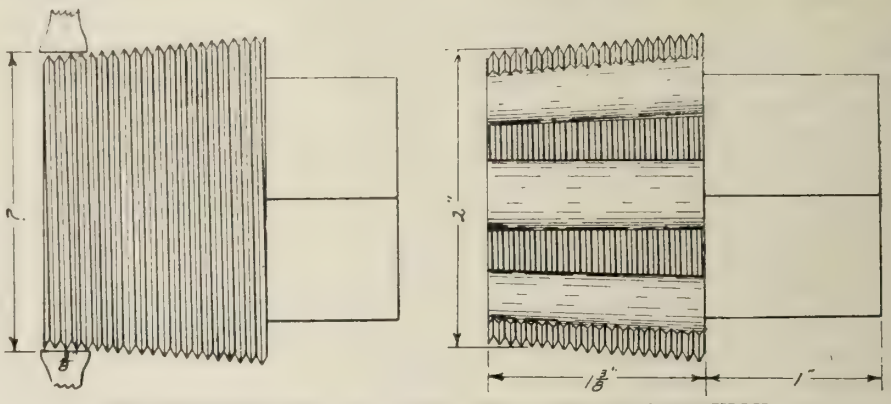
# WHAT OUR READERS THINK AND DO



### LOCOMOTIVE BOILER MUD HOLES.

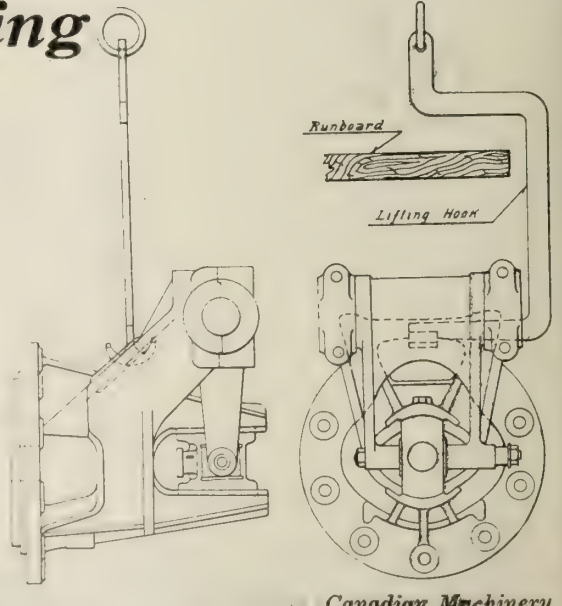
By H. BAILES.

Anyone familiar with the present method of gauging these mud holes with a plate knows that this system is inaccurate. First of all, dirt and rust adhere to the threads, and secondly, the plate only measures the bottom of thread on plug. In the rush of making a speed "test out," quite frequently the taps are not put in these holes to clean out or straighten up the threads, with the result that many plugs are blowing steam when the engine ought to be leaving the shops.

After tapping all the holes in a boiler, the writer has used with good success a set of old plugs for the purpose of gauging the size of these holes. The plugs are from 1⅞″ diameter to 2½″ diameter, these increasing by 1-16″, this making eleven plugs to the set. The size of the plug is determined by calipering the fourth thread from the end, i.e. ⅜″ from the end, or the width of a pair of outside thread calipers.

Each plug is stamped on top as follows: 1-7, 1-15, 0, 1, 2, 3, 4, 5, 6, 7, 8; 0=2″ diameter, and the whole numbers above this signify 1-16″ increase in diameter. No. 3 represents 2 3-16″ diameter; No. 4, 2¼″ diameter, and so on. Below the cipher No. 1-7=1⅞″ diameter; 1-15 1 15-16″ diameter. In use, the practice is to chalk above each hole the number of the plug used. Thus, the abbreviated method of marking comes in very handy.

THE TEXT EXPLAINS FULLY THE IDEA. READ IT CAREFULLY.



In some cases a plug may enter three or four threads only. For example, suppose this happened with a number four, or 2¼″ diameter plug. A No. 3 plug would enter this same hole to within four or five threads of the top. What would be the size to take? In such an instance, the mean diameter or 2 7-32″ would be correct, the hole to be marked 34, signifying the diameter as being the mean of these two sizes. Thus, 56 would equal 2 11-32″; 1-31 = 1 31-32″, etc. From past experience, I found these sizes comprise the standards excepting inspection holes and one or two isolated cases, viz.: 1⅝″, 1¾″, and 1 13-16″ diameter, which may be determined by inside thread calipers.

Now, substitute taps for the plugs, i.e., plugs duplicated in hardened steel, and milled with teeth for cutting purposes. The mud holes of many boilers vary from three to four sizes, so it is merely a question of measuring one hole with your scale and securing one or two plug taps above or below the size measured. By this method you are sure to use the

## *Lifting Tackle for Erecting Shop*

The drawing illustrates a lifting tackle designed for use in locomotive erecting shops for removing or installing combination back steam chest covers to cylinders, where, owing to the confined headroom difficulty has been experienced in placing covers in position. The old method—a dangerous one—was to use a bar in conjunction with a chain hanging from the crane, requiring three men and a slinger for the purpose. The hanger here shown is in the form of a U-hook, designed to clear the running board and still give a direct lift. Hook is arranged for right and left hand lift, tip of the hanger gripping the edge of the opening in the top of the cover, where the latter is perfectly balanced. With this device only one man and slinger are required, and danger of accident is eliminated.

*By F. C. H.*

taps, and besides, these taps are more effective, to my mind, in tapping new holes than the usual long standard tap.

The method of using old plugs is also expensive and inaccurate, the process being to anneal them before sending to the lathe. The lathe hand has plate sizes for one set and proceeds to chase the threads up with a hand chaser. In many cases the plugs are returned with a taper which does not correspond to the hole. In conclusion, I would suggest a set of adjustable dies, graduated similar to the plug taps, of the same taper and pitch, so that the old annealed plugs could be rethreaded by unskilled labor, using an old drill head.

## TWO STORIES OF INTEREST

By D. A. HAMPSON

Two of our planers ran continuously on "51-inch plates," as they were known in the shop. These were castings about six feet long that were made from patterns 51⅜ inches wide, which gave us ample to face to an approximate width, and also allowed plenty of clearance on the machines. One planer was a 54-inch, the other exactly 52 inches between uprights, and on this latter we had to centre our castings pretty evenly to clear.

We drilled three holes in each end for finger clamps and these clamps very nearly centred the pieces. Then, before tightening the bolts, the planer hand would check up with his scale to see how even the casting was with the edge of the table, shifting if need be to "divvy" any irregularity in width. We knew from experience that this setting would pass the uprights of the 52-inch planer—so the operator's procedure was to immediately start the motor, give the reverse lever a kick and bend over to set his cut.

He was bending over to set his tool in the work one April morning, when, presto! The gears emitted a sound of heavy pulling, the forward belt slid off and the table stopped—with half the length of the casting under the rail. Stuck! A swell in the casting, such as we had never known before, had blocked it completely.

Try as we might, we couldn't get that casting free. We even blocked up our twenty-ton jack and tried to push the casting ahead on the table. Nothing doing. The machine was a heavy switch and frog planer with a good 20 horsepower motor behind it and it had a full measure of driving power. We might have loosened the casting by the battering ram method, but this would have ruined it, at the cost of $150. Finally, we had to remove the cross rail and then we were able to shove the off-side upright away enough to free the plate. Needless to say, we never trusted the size of a casting again.

### Another Peculiar Case

Quite different from the planer event was one met with on an outside job. Our town owned a stone crusher which had been situated on the north road for ten years past. A better and cheaper supply of stone was offered at the opposite end of the city, and, as there were other advantages, it was decided to move the crusher plant to the new location. Our shop had the job of taking the machine down and setting it up again. Jim Muir, the old Scotch truckman, who did most of the heavy moving locally, was to transfer the parts as fast as we got them disassembled.

The crusher was not of the portable type—the big base casting was firmly set and bolted on a massive concrete foundation. The base was planed flat on top. On this base was bolted the heavy frame of the machine itself. We had taken off the flywheels and other assembled parts and had only to get the frame loose from the base, to take the nuts off the foundation bolts, and half our job would be done. But on outside work, it is never safe to cry "Finished" until you get back to the shop.

We took out the bolts all around, and so far as we could see there was nothing more to hold the frame to the base, so we had the boys give her a pry with the bars. That did not do and we took another look around to see if there was a bolt we had skipped or a dowel covered up with paint. There was neither. We had our fifteen-ton jack along and that made us feel secure against any little thing like a rusted fit. This jack was placed with its head under a friendly hub on the frame and one of the boys told to hurry up and pry her loose. He was a rugged lad but he called for assistance after one perplexed effort. Three men on the bar failed to raise the offending casting and the boss said to go home for the day while he thought it over.

Next morning we rigged up a gin pole over the crusher. From this we hung one two-ton and one three-ton chain hoist. Slings from these were passed around the frame.

Then each hoist was manned by three men, and three men were put on the lifting jack. At last we were really armed to attack this obstinate four-ton casting. The boss gave the word and everybody strained. Nothing doing. We tried again and again with the same result.

Sweating, the boys stopped long enough to give vent to some strong language. We had done our best and lost. The only solution we could offer was that there were tap bolts up through the bottom, but that didn't seem possible either for they couldn't be put in unless there was a pit under the base.

Just then Mr. Muir appeared with the heavy wagon to take away the piece we could not loosen. He asked to see us try it once more, and we went through the same humiliating performance. "Well, boys," said Jim, "you've done all you could do and it's not enough yet. Now, just for luck, let me take that twenty-pound sledge and tap around the bottom while you give her one more pull —as long as you've got everything rigged up, I'd like to try a few blows while you put a strain on."

And we learned something right there for at the fourth swing of the sledge—snap! That frame came loose just as nicely as anyone could ask. There was nothing but weight and rust holding those two flat surfaces together. But we had been treated to a demonstration, not soon to be forgotten, of the fact that a blow applied to a part under stress has wonderful effect.

## STRAIGHTENING ROTOR SHAFT

BY JOHN S. WATTS

I read with interest the article on straightening of rotor shaft on page 47 of Feb. 10th issue of Canadian Machinery. I noted that the editor questioned the method employed, because as he expressed it, the method adopted did not relieve the internal strain in the shaft caused by the bending. He suggested that the shaft should have been heated by a blow torch, straightened by pressure, and after being annealed at a dull red heat, trued up in the lathe.

As the bending of shafts and other parts, by rough handling in transit, or by accidental over-strain in operation, is of fairly frequent occurence, I think it would be valuable to have this matter well discussed, in an effort to determine the one best method.

That it is impossible to get a bent shaft exactly straight again, by pressing out the bend, is well known to all who have tried it, and is apparently not disputed by the editor, who specifies trueing up the shaft in the lathe, as the final operation in his criticism. To do this means turning enough off the shaft, to permit the insertion of a bush, of a practicable thickness, in the bore of the pulley, to make it fit the shaft after it is trued. The bush would have to be at least an eighth of an inch thick, thus reducing the shaft one-quarter of an inch in diameter, and seriously weakening it at the point of greatest stress.

Possibly this reduction of diameter could be made just sufficient to true up the shaft by making or purchasing a new pulley to suit, but as these motor pulleys are finished all over and balanced, on account of the high speeds they run at, in nearly all cases the delay incurred in getting a new pulley with a special bore would be fatal. Experience in straightening shafts will show that in straightening out the one bend we infallibly cause another small bend, which in this case would occur in the bearing, and for a good job we would have to true up the shaft at the bearing, and so be compelled to also re-babbitt the bearing.

The main point the editor makes is that the shaft is under the permanent

initial strain imposed when bent, and that this strain is not relieved by the heat of welding. In a long experience I have seen many bent parts straightened, mostly always cold, and have never seen any annealed after straightening, nor have I ever known any failure from this lack of annealing. It seems to me that practical experience proves that a slight bend which gives no indication of having been sufficient to impose a stress approaching the breaking stress, while it undoubtedly must have strained the shaft beyond the elastic limit does not actually injure the shaft permanently, as the strain in a comparatively short period of time disappears, presumably by readjustment of the molecules, to accommodate the new shape of the shaft. It takes, to my mind, as much pressure to straighten a shaft as it does to bend it, so that this bears out the above statement, within the limits of one or two bendings, of course.

If the bend is so severe as to cause cracks to show in the shaft, the strength of the shaft is obviously permanently impaired, and it would be useless to straighten it, but the bends actually met with are very seldom in this class. Unfortunately, we do not at present know much about the behavior of steel under stresses between the elastic limit and the breaking stress, but the fact that steel can be stressed beyond its elastic limit a few times and recover its original strength, without any treatment, is shown in actual practice. For instance, the shell plates of every boiler that ever was built are strained past their elastic limit, in rolling to shape when cold, and evidently suffer no harm from it.

Another case is that of cold twisted bars used for reinforcing concrete. This cold twisting involves stressing the bars beyond the elastic limit, and yet tests show that the twisted bar has an elastic limit at least 60 per cent. higher than the original bar, and a tensile strength about 20 per cent. higher. That cold rolled shafting is stronger than the plain shafting is well known, and other like products could be cited which prove that a material stressed only once or twice, to a point between the elastic limit and the breaking point, is no weaker than it originally was, if not indeed stronger.

In Kent's Pocket Book are cited some tests proving the truth of this, and from page 239 of the first edition I copy the following: "The common opinion that straining a metal beyond its elastic limit injures it appears to be untrue. It is not the mere straining of a metal beyond one elastic limit that injures it, but the straining, many times repeated, beyond its two elastic limits."

Finally, then, my opinion is that Mr. Quist handled the job the best way, because he got a true shaft of the original dimensions, and that the internal strains from the bending are not of any importance, if indeed they exist at all.

## EMERGENCY HINTS.

By A. L. MARSHALL.

While it is granted that the modern lathe is equipped with all thread cutting facilities, how about the poor old repair man, who must struggle along, in many cases, with very out-of-date equipment?

For example—suppose you had a few screws to cut 3-16″ diameter, 30 threads per inch, but your index showed only 28 and 32, but no 30. What would you do? Suppose the lathe you are using has a feed screw 5 pitch. Set the lathe for cutting six threads per inch and use the feed 5×6, this equalling 30. Of course, you cannot pick up the thread, but will have to run the lathe backwards before starting another cut.

Here is another dodge. Suppose a lathe will cut up to 14 threads per inch, but you suddenly need 16 threads per inch, on say a part ½″ long. You are in a hurry, so looking on your index you discover 3¼ per inch. 3¼×5=16¼ and half of this equals 8⅛. Now, the ⅛÷1-16″ = 1-128″, the amount of error, so if the job is not too important, go ahead. In any case, it's a good dodge if you're stuck.

## MAKES TRAIN-STARTING EASIER

By the use of the new electro-pneumatic brake which is just being inaugurated on some of the trains of the Pennsylvania Railroad, the starting and stopping of trains will be accomplished with more ease than heretofore. Especially with long trains it has been impossible to start a train without some shock to the passengers, but the object of the new system is to secure a rapid simultaneous application and a graduated or direct release of the brakes on all cars, regardless of the length of the train, thus avoiding the objectionable slack action between cars. A turbo-generator situated at the top of the locomotive smokebox generates direct current at a pressure of 110 volts for actuating the electric magnets on the air brake valve of each car. When the engineer switches on the current and applies the air brakes, he is enabled to make a quick, smooth and safe stop, and the objectionable slack action between the cars is thereby avoided.

# *Cylindrical Tank Data*

### *FIGURING CONTENTS WHEN PARTLY FILLED*

The sketch and formulae show the method used in finding the quantity of liquid in a partly filled tank when it is resting in a horizontal position.

Example:—An oil tank six feet in diameter and ten feet long is filled to a depth of 4 1/2 feet; how many gallons are in the tank?

The area of the tank end equals:—

$.7854\ D^2 = .7854 \times 6^2 = 28.274$ sq. ft.

To find the area of the end of the contents it is first necessary to find the area of the segment e g c h. From the formula we find that half the chord (c g) equals the square root of the product of the height of the segment and the remaining portion of the diameter.

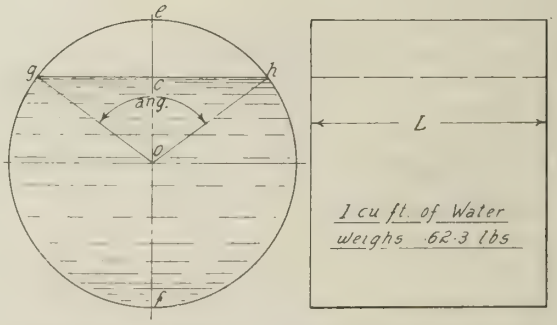
Half the chord (c g) $= \sqrt{1.5 \times 4.5} = 2.6$

Sine of the angle c o g $= 2.6 \div 3 = .8666$

Corresponding angle equals 60 degrees.

Area of the sector e g o h $= \dfrac{28.274 \times 120}{360} = 9.4246$ sq. ft.

Area of triangle g o h c $= 2.6 \times 1.5 = 3.9$ sq. ft.



Area of segment e g c h $= 9.4246 - 3.9 = 5.5246$ sq. ft.

Area (a) of the end of contents $= 28.274 - 5.5246 = 22.7494$ sq. ft.

Volume of oil $= 22.7494 \times 10 = 227.494$ cu. ft.

Capacity $= 7.48 \times 227.494 = 1701$ 1/2 U. S. S. gallons.

Weight of contents (specific gravity of 1.2) equals $62.3 \times 227.494 \times 1.2 = 17{,}007$ lbs., or about 8 1/2 tons.

A = area of end = .7854 $D^2$ a = area end of contents

ec . cg = cg . cf cg = $\sqrt{ec \times cf}$

Sine of Ang. cog = cg ÷ og

Area of Sector egoh : A = ang. goh : 360

Area of triangle gohc = $\dfrac{gh \times co}{2}$

a = A − area of segment egch.

Vol of Tank A × L. Vol of contents = a × L

Capacity in U.S.S gal = vol in Cu. ft × 7.48

" " Br Imp " = " " " × 6.23

# Improve Your Powers of Perception—Try This Contest

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Only one contestant had a correct list this week, F. M. Conant, of the Canadian Link-Belt Co., being the gentleman in question. The scale goes forward to him at once. Who will be the next?

**CONTEST FOR APRIL 21ST ISSUE**

**Contestants are required to write us, stating to which advertisements we refer in this number.**

1—Something free—and well worth having.
2—A product that gives protection against electric shocks or heated parts.
3—Something that helps to keep products on the move.
4—How to find out about raw hide pinions.
5—A method of eliminating a certain kind of cost.
6—How to get everything you require for a certain kind of shop.
7—Something said to be almost 100% efficient.
8—A product said to cut faster and last longer.
9—Something said to be a vital necessity to present day production.
10—A product that has been produced for the past forty years.
11—An important announcement.
12—A product said to be especially adapted to drop forging plants.

**These are Correct Answers for List from March 31st Issue:**

1—Elk Fire Brick Co. of Canada, Ltd.
2—R. S. Holly
3—Landis Tool Co.
4—Carlyle Johnson Machine Co.
5—Hendey Machine Co.
6—Canadian Ingersoll-Rand Co.
7—The Bristol Co.
8—J. H. Williams & Co., Ltd.
9—Brown & Sharpe Mfg. Co.
10—Smooth-On Mfg. Co.
11—Wright Mfg. Co.
12—Gisholt Machine Co.

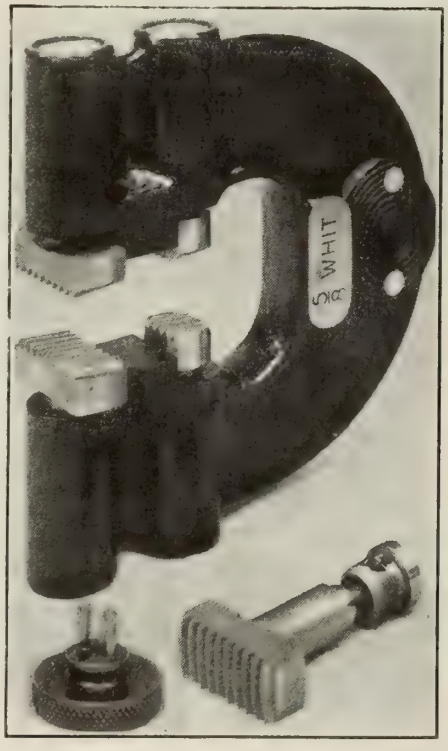
## Closing Date for This Contest is May 12th

# DEVELOPMENTS IN SHOP EQUIPMENT

## WICKMAN GAUGES

The Alfred Herbert Ltd., Coventry, England, with offices at 1-3 Jarvis St., Toronto, has placed on the market a line of adjustable plain and thread snap gauge known as the Wickman type.

This gauge has been developed from the plain adjustable type of snap gauge, and the frame is of high quality chilled cast iron of such a section as to reduce elasticity to a minimum. If the frame is thrown to the floor with sufficient force it will fracture. This is a safety factor. As stated by this concern, a gauge having a drop forging frame would still be intact—but on the other hand considerable error would no doubt have set in because of the heavy fall, with the result that valuable work would be spoiled.



The first set of anvils are threaded in a precision lathe to true form, and after hardening are tested for pitch, and projected for accuracy of form. The various elements are also measured by means of od. V's and needles, in the same manner as a screw plug gauge.

The second set of anvils is shorter in lengths than the first set, consisting of only two or three threads which are cleared completely at the root and topped off at the crest. They merely test the effective diameter of the screw. They are calibrated by means of standard N.P.L. needles and the distance from the topped off portion to the true effective diameter is etched as a constant on the back of the anvil.

Assuming the first set of anvils set up to a hardened and ground plug (the size of which is the true core diameter of the thread to be gauged), or to slip gauges wrung up to the core diameter, the anvils will present a section of a perfect ring gauge. On the work being passed through them it will be obvious that no element of the thread on the work is larger than nominal.

Assuming that .006 inch is the predetermined limit which can be allowed as a decrease of effective diameter or thinning of this thread in order to produce satisfactory fits and long working life, the second set of anvils is set this amount below nominal by means of another plug gauge, or by means of slip gauges wrung to size. The second set of anvils will now represent the true section of a "no-go" effective ring gauge .006 inch below size, and if the work does not pass through these anvils it is obvious that the effective diameter is not below this predetermined amount and, therefore, the screw will not only assemble into the component, but will also assemble to a predetermined fit, and have a known length of useful life. If the screw will not pass the first anvils, on holding the gauge up to the light, with the screw between them, the operator can easily see what element is interfering and knows what to correct. Each of the anvils has an adjustment up to ⅛ inch, making a total adjustment of ¼ inch.

The references are merely hardened and ground steel cylindrical or slip

GENERAL VIEW OF THE GAUGE.

gauges, and these thread snap gauges can therefore be inspected periodically at a minimum cosst. In this way, there need never be an inaccuracy in the set-up gauge of more than .0003 inch. The mechanism of the gauge is so arranged that it is impossible for the anvils to get out of "square" and also the gauge is absolutely tamper-proof.

The adjusting screw is covered by the locking screw, which in its turn is covered by a lead seal, closed into the recess at the top of the gauge by means of a special press. This press indents the firm's trade-mark in the seal thus preventing any unauthorized tampering or alteration.

The adjustment of the gauge is very simple and is such as permits of extreme accuracy. The stem of the anvil, which is hardened and lapped to fit the hole, is coned out on the top end to an angle of 60 degrees, in which rests a hardened steel ball. The adjusting screw, which is also hardened, has a similar cone underneath it and presses down on the same steel ball. The locking screw, the head of which bears in a counter-bore on the top of the gauge, passes through the hardened adjusting screw, through the clearance hole in the steel ball and into a tapped hole at the bottom of the countersink of the stem of the anvil.

Two holes are provided in the head of the locking screw and a special peg spanner (with prongs which go through these holes in the slots of the adjusting screw) is used for setting the gauge. To set the gauge, screw out the locking screw with a screw driver a number of turns, drop the peg spanner in position and rotate. The pegs will drop into the slots of the adjusting screw and rotate it; the cone of the adjusting screw will push down the hardened steel ball which in its turn will force down the stem of the anvil.

By giving the locking screw an extra twist with a screw-driver, it is possible to get any desired feed between the anvil and the setting gauge. The hardened steel ball is elastically compressible to a few ten-thousandths of an inch. For example, it is possible with this adjustment to pick up a set of slip gauges between the anvils; give the locking screw an extra slight turn, and the gauge will not pick up the slips. Release slightly, and the anvils will grip the gauges once more. This system of adjustment is the finest possible and when once locked it is impossible for any backlash to be existent. When the gauge is finally sealed, tampering becomes an impossibility and an attempt to set the gauge in a vise would result in the fracture of the frame.

To sum up briefly, the claims are as follows: 1. Length of life of the adjustable thread snap gauge is many times that of the ring gauge. 2. Complete visibility of any existing errors in thread to be gauged. 3. Absolute limit on the minimum effective diameter. 4. Easily inspected. 5. Easily adjusted. 6. Absolutely tamper proof when adjusted. 7. Tests "out-of-roundness" or concentricity. 8. Combined "go" and "no-go" gauge. Only one adjustable thread snap gauge is required, which is cheaper than

the two ring gauges often employed, and 9. Maintenance charges are negligible.

In another portion of this issue is given a further discussion on gauging, which space in this department did not permit.

### QUICK ACTING DROP HAMMERS

The Massillon Foundry & Machine Co., Massillon, Ohio, have placed on the market a line of small size, quick acting drop hammers for use on light work. These hammers are built in sizes of 400, 600 and 800 pounds capacity, but other sizes can be built to meet special requirements, and the hammers can be operated by compressed air in place of steam, if so desired. The housings and base are steel castings and the cylinder is a semi-steel casting. The company has incorporated in these small hammers its design of adjustment for the ram guide that was originally brought out on hammers of larger size, to permit of the ready removal of damaged push-bolts. The guide adjusting screws are threaded through nuts set in open pockets in the side housings.

### PRODUCTION TOOL HOLDERS

The Canadian Production Tool Co., Ltd., Walkerville, Ont., have placed on the market a line of tool holders that are a radical departure from the usual type. These holders are made of steel and are of very rugged construction. They are so designed that they can even use broken or worn drills as turning tools. This, of course, applies to the type of holder using round stock. In one particular case that has been brought to our attention, a worn drill was used as a turning tool on a nickel vanadium steel piston rod with splendid success.

These holders are made for round steel, square steel and regular cutting off steel section. In some cases double blades of cutting off shape are used, these performing operations such as cutting packing rings, spacing collars, etc. Then there is the wheel lathe tool holder which is designed to eliminate forging time of heavy steel, small bits fitting this holder in place of the heavy stock. In other cases special holders are made these including draw shaper tool holders of special construction to suit conditions.

In all the holders the chief idea is rigidity and saving in tool steel cost, as tool bits can be used in place of the regular large piece of steel, and the small scrap of high-speed steel usually found in any machine shop can be utilized. The straight round turning type of tool holder is shown in the illustration, and from this readers can gather the general construction of these holders.

### ADJUSTABLE BORING BAR

A special boring bar designed for the boring of holes from 1½ to 9 inches in diameter has been placed on the market by the Murchey Machine & Tool Co., of Detroit, Mich. The construction permits of accurate adjustment of the cutters to within 0.001 inch of hole diameter. Cutters can be rigidly secured after setting. Shanks of any desired size or shape may be furnished.

### SLIP-COLLET DRILL CHUCK

The Dompier Chuck Co. of Detroit, Mich., are now manufacturing a quick-action drill chuck of the slip-collet type, specially designed for the triplex operation of drilling, boring and reaming. The collet may be inserted in the holder by the use of one hand only and may be removed from the holder by simply raising a knurled collar on the outside of the chuck. Wearing parts are made of chrome-nickel steel, hardened. The chuck is made in four sizes and holes are tapers to receive Morse shanks.

## The International Harvester Case

ONE of the most important moves made in the history of industrial relationships was that enacted at the Hamilton plant of the International Harvester, Ltd. A reduction in wages and piece-work rates was found to be necessary, owing to the changed prices at which they were selling the finished article and also owing to the dropping off in sales.

The Works Council of the plant dealt with the matter and five of the representatives of the men spent five days investigating the records of the company upon which the reduction in wages had been based in the first place. They were given every opportunity to go through production figures, cost records, orders booked, etc., in order that if possible they might bring out any other solution except a reduction in the wages of the workers.

At the end of this time they brought in their finding in which they state frankly that the company is justified in making the reduction in piece-work rates and wages, which they regretfully recommend should be accepted by the men in the plant.

It is a simple matter to share profits when times are good, but it is an entirely different affair to ask men to come and share the lean days of the company.

It must be that the Harvester people have won the confidence of the men to an unusual degree. Workers in a shop are not unreasonable when a firm will take the trouble to put all the cards on the table before the reasoning starts.

It is surely a great deal better for all concerned that representatives of the men should have gone over the records of the company's business, have an opportunity to see what the firm was doing, get in touch with the problems the executives have to face, than that they should be confronted with a typewritten notice pasted on the time clock, making the curt announcement that wages had been reduced.

One may argue that it is an easy way out for the company? Is it?

As the market stands at present, the easy way out would have been for the International to shut up shop for a period in order to get rid of the stock of implements it has piled up. The action of the men in accepting a reduction puts it up to the company, in a new way, to keep on running.

The development is interesting because it is human and wholesome. It shows that there is a place for Works Councils and kindred organizations and demonstrates that if frank honesty is established between office and shop, it is quite possible for each party to drop the gas pipe that has too long been carried up the sleeve of industrial leaders on both sides of the question.

## The New Steel Prices

THE coming of the new schedule of the U.S. Steel Corporation was not unexpected. It had been common talk for weeks and it remained only for Judge Gary to fill in the blanks that the guessers in the market had spread out before him.

In a general way the trade in Canada is pleased with the new schedule. It comes down enough to be a reasonable price and it does not come so far as to cut the ground from under the feet of those who have fairly large stocks either in warehouses or factories.

Warehouses can go ahead on their present selling prices. The new U.S. prices become the basis for operations here, but warehouse selling has been largely for liquidation for some time past.

No doubt an effort will be made to establish new market standards for this district when present stocks are lowered. Just now price-cutting is being indulged in. There may be more fancy names for the practice, but that is the actual condition.

Bar iron, for instance, is selling at so many prices that it would keep a sharp young man busy placing them on record. We hear of sales all the way from 3.50 to 4.25. The new price at Pittsburgh—and on this price Canadian mills must base their sale price—is 2.10 cents per pound. At present rates of freight and exchange, it means 3.16 put down in Toronto. If dealers are going to make a reasonable profit the new market will have to be built around four cents.

It can hardly be urged that the new prices will bring about a buying movement, although certain tonnages that have been held up awaiting the new price have been released.

The two-headed steel market has more or less disappeared and there is reason to believe that present prices will hold for a reasonable time.

Taking an average ton, that is, pooling the prices of Bessemer steel rails, plate, wire nails, steel beams, steel bars, tin plate, Bessemer iron and steel billets, we find the new schedule is $58.54 per ton, against $63.49 before. In 1920 it was $78.21; in 1919, $65.92; in 1918, $70.52; in 1917, $91.01, and in 1914, the year the war started, $30.97.

The market now has the advantage of a price on basic materials that it can accept with confidence. Heretofore no selling schedule could be absolutely relied upon and it brought with it a condition where buying was of necessity reduced to a minimum.

---

"Iron Trade Review"—Examination of market trends over the past few years shows that practically all major movements in steel and pig iron have been preceded by a movement in scrap prices. The response of other prices has varied from two weeks to two months after scrap but in each case has followed unerringly.

## Russia Must Reform

CANADIAN firms are making little effort to secure trade with Russia. They have no guarantee of stability and some of them have vivid recollections of large losses following the overthrow of business order and honorable business methods there.

The U.S. Secretary of State, while expressing the sympathy of his people for the people of Russia, can see no chance for business with Russia until Russia becomes a different Russia. Production is the big chance for Russia and it is also the big chance that the present leaders of industrial and national damnation in that country wish to avoid.

The Secretary of State, on this point, says: "Production is conditioned upon the safety of life, the recognition by firm guarantees of private property, the sanctity of contract, and the rights of free labor. If fundamental changes are contemplated, involving due regard for the protection of persons and property and the establishment of conditions essential to the maintenance of commerce, this Government will be glad to have convincing evidence of the consummation of such changes, and until this evidence is supplied this Government is unable to perceive that there is any proper basis for considering trade relations."

Canadian business, we believe, will readily subscribe to that statement. There are enough industrial quicksands in our own country without reaching out to stick a leg in the Russian mess.

---

Some worthy chap rose up this week and said: "In every business concern, large or small, there is, on the part of every individual, a natural eagerness and desire to get ahead, and more or less rivalry ensues as a result. It is a great mistake, however, to have uppermost in mind the idea of 'beating the other fellow to it,' some particular friend, associate or neighbor. Such rivalry breeds animosity and trouble. The surer way is to get ahead of yourself each day—never mind the other fellow."

---

"American Machinist"—In one recent case of this kind a contract was taken at what seemed a very low figure and the high bidder protested that it could not be made for the price asked. So the successful bidder showed his shop time on the job to be 48 hours, as against the other bidder's estimate of 155 hours. A comparison showed modern equipment in one plant—out-of-date machinery in the other.

## ANY OF THESE EXERCISES NEEDED AROUND YOUR PLANT?

NOW, this chap whom the cartoonist has put on the flat of his back is not having a good time.

But he is having a time that is going to be good for him.

Does this man look like your business, your prices or any part of your organization?

Perhaps he may resemble some of the left-over, war-time ideas and customs.

He may represent some of your selling methods. If so, you better pull all these fat boys out and put them on the mat.

There may be some hurt feelings—there may be a few squeaks.

The truth is you have got to get on the carpet and shake out the useless material, no matter whether it's in your own system or out in the mechanical department.

Perhaps your surplus fat consists of a lot of old rattle-trap equipment that you know right well will have to be booted when operations get geared up to anything like capacity.

Those old machines have been wheezing away for years. When you are showing your friends through the plant you try and tell a good story that will raise a laugh when you are passing them. You really don't like to pull up in front of them and say: "This is my plant."

No matter where your surplus weight hangs, better get it out on the floor and start the reducing exercises.

—Harding in Brooklyn "Eagle."

**There's always some hardship about these reducing exercises.**

# MARKET DEVELOPMENTS

## New Steel List is Well Received by the Market

### Cuts Made Give Dealers and Others Holding Stocks in This Country a Chance to Get Rid of Material—Number of Prospects in the Market But Actual Business Signed is Not Large

THE Canadian steel trade seems to give a very favorable reception to the new schedule announced in the United States Steel Corporation. Dealers in steel are glad that the cuts went as far as they did and they are also pleased that they stopped where they did. Many manufacturers, for the present at least, take the same attitude, as a deeper cut would take too much ground out from under their feet and embarrass them for future operations. As the schedule stands at present the market agrees that it should form a basis for operations for the next three months and after that deviations from it, if there are any, will be small. No one claims that it is going to start a buying movement, for if that were possible by announcing a new price list, it can be taken for granted that the Corporation would have put out the new list weeks ago. The market is undoubtedly stronger to-day than before the list appeared and the bringing about of that condition was essential to better business in the future.

The machine tool trade has had a quiet week and the selling of used equipment experiences the same condition. There are a number of very good inquiries in the market, but the absence of pressing need for equipment makes it possible for the should-be buyers to keep putting off the actual purchasing of equipment.

Small tools are being taken for actual needs only and considering the low rate at which many of the shops in this district are operating, this means a slow business for the dealers.

The scrap metal market shows no more strength than it has for a good many months past. Figures quoted are purely nominal and dealers will pay them only when they have to.

Pig iron is now selling for $34.10, and car lots are about the limit of buying. One furnace is prepared to keep going until it has piled 20,000 tons.

## MONTREAL DOES NOT EXPECT ANY CHANGE BECAUSE OF NEW SCHEDULE

Special to CANADIAN MACHINERY.

MONTREAL, April 21.—Local industry seems more or less inactive at present although business is showing slight improvement in some quarters. The unemployment problem is less acute, owing to the large number of men recently started by the Tramways Company in the laying of new roadbeds throughout the city streets. The harbor is gradually assuming its normal spring activity, although it will be some weeks yet before operations are at the maximum. Reports from many merchants reflect the gradual lifting of the depression that has hung over the business world for many months, but the trend toward improvement is so gradual that it is noted only by the observing optimist.

#### Local Market Not Affected

Despite the fact that the trade has been looking forward to an announcement by the United States Steel Corporation, regarding a downward revision of prices, the reductions made last week have not yet been felt in this district. As one dealer put it: "There is practically no business going through and the matter of price has little influence on the market. We are told that some mills in the States are quoting as low as $2 on plates but even at this figure there is very little booking being done. A general revival of business must take place before buying of steel will be resumed." The interest of the trade just now seems to be centered in the coming developments in railroad circles, as it is felt that any resumption of activity is dependent on an early and satisfactory settlement of the railroad problem, both as regards to wages and freight rates. A steel merchant here, who has reported a weekly improvement for the past several weeks, again states that sales continue to increase and that they expect this month's business will surpass any previous month's since last fall. "However," said the dealer, "it will require to improve considerably more before we are back to normal."

#### Business Slowly Improving

While nothing of an outstanding character has developed in local machine tool circles, business is considered fairly good in face of the quiet industrial conditions now prevailing. "Sales are not large," remarked one dealer, "but we continue to dispose of machinery and equipment in sufficient volume to make the month's aggregate compare favorably with that of previous months." This is the substance of the remarks generally made by the average dealer and one has often to make his own calculations as to the extent of "good business." One thing is certain, and that is, that dealers and jobbing houses are getting rid of much of the stock carried over from last year before replenishing their floors or shelves with new materials. There is a gradual lowering of quotations on standard equipment. "Since the first of the year," said the dealer, "it is safe to say that a reduction of about 15 per cent. has been made on the selling prices of nearly all the principal lines." A period of anticipation seems to be passing just at present, as indicated in the remark of a dealer here this week. He said: "We are now passing through a period where any idea of profits must almost be forgotten. How long this will last, no one can tell, but we feel that we are on the verge of that long looked for 'readjustment' that will eventually lead us into the paths of a real industrial revival."

There appears to be a goodly demand for the lighter factory supplies, but heavy machinery is moving slowly. Fairly good sales of wire rope are reported.

**Metals Are Not Affected**

"The movement of metals is dependent on industrial activity and until general business shows improvement we cannot expect to see a heavy demand for ingot metals. We are disposing of quite a quantity of ingot and sheet metals but usually in small lots, the practice apparently being for consumers to purchase only what they require for immediate use." This statement regarding the metal situation might well apply to many other lines, as the policy on every hand seems to be one of careful conservatism.

## NEW PRICE LIST IS APPROVED HERE

**Schedule of U.S. Steel Corporation Will Not Make Much Difference in the Markets**

TORONTO.—The machine tool market, the steel market, can be described as "spotty." One dealer claims that business has been very poor with him for some weeks past, while the very next place will show records of shipments and orders that have made a very good showing in the same period. So a person really has to make a good many calls now in order to collect enough information to get a fairly accurate view of the real situation.

Machine tools are not moving fast. The general manager of one large firm in Toronto, discussing the situation this week, said: "Buying for the present seems to have been pretty well tied up. It is hard to see that it is a matter of price, although there are some statements put out that the reductions made by many of the makers are not final, and that better figures will be coming shortly. I can't see where this comes in at all. Judging from our own records it would not be correct to say that many sales are being held up by the price now. The used machinery market is also dull, although the wood-working end of it is showing up better than the selling of metal-working equipment."

Another dealer was quite certain that in the next two or three months he would close quite a few orders that were not yet advanced beyond the consideration stage. A number of firms had fully decided on what equipment they wished to put in, but the actual placing of the business was being held up for the present. It is a tiresome piece of business, waiting for orders that have been practically closed, but the business is good and will come into the market eventually.

The sale of small tools, reamers, cutters, taps, dies, drills, etc., is still being carried on in a very small way. The orders coming in call for such supplies as may be actually needed, but nothing more, so with the present low rate of operation in many of the plants the business coming to take care of day-to-day breakage is very small.

## POINTS IN WEEK'S MARKETING NOTES

**Armstrong, Whitworth of Canada state that lack of protection has made it necessary to close their steel tire plant at Longueuil.**

**Many dealers are selling at present with the idea of getting stocks as low as possible, regardless of what they miss in the way of profits.**

**Dominion Steel Products at Brantford are taking over the Darling Valve & Manufacturing Co., of Williamsport, Pa.**

**The machine tool market is quiet, although some interesting inquiries continue to come into the market.**

**Canadian trade seems to be well satisfied with the new schedule announced by the U. S. Steel Corporation.**

**Pig iron is now offered by Canadian makers at $34.10, following the acceptance of the $25 level at U. S. points.**

**Scrap metal market is dull, with prices nominal and trading in small quantities.**

**In the Steel Market**

The new schedule of the United States Steel Corporation has formed the topic of conversation in the steel market this week, and general satisfaction seems to be expressed at the extent of the reductions made. Most of the local warehouses have been engaged for the past three or four months in getting rid of stocks of high-cost bars, of which some of them had quite a tonnage.

Some of the independents have done as low as two cents on these and reports had it that the Corporation would go as far down as 1.75. Instead, the new price is 2.10 against 2.35, the former figure. At present rates of exchange this will mean about 3.16 laid down in Toronto, making the warehouse price around 4c, which can be regarded as fairly close to the present market. Of course, there will be profit for merchants at 4c, when they get shipments at the new price, whereas there is no money in it for them selling out high cost bars at 4c.

Structural and plate are again at a flat rate of 2.20 against 2.45 for the former and 2.65 for plate. Coming back to the same price is reverting to pre-war practice. During the war the call was for plate, and it got a premium price owing to the demand.

**The Effect on the Market**

A. T. Enlow, president of the Dominion Sheet Metal Corporation of Hamilton, a large buyer of sheets, believes the new prices will tend to stabilize the market. He holds that the independents and the Corporation will agree on prices. J. G. Near, general manager of Peckovers, Ltd., Toronto, was satisfied that the announcement would give some confidence in the market for the next three or six months at any rate.

Mr. David, of Baines & David, believed that the most that could be hoped for at the present time would be an added stability to the market. "We can't be busy and well employed here with the other part of the world not yet recovered from war," is his view. "Under the circumstances," added Mr. David, "the new price list has been very carefully compiled."

The general feeling in the market was that the time was ripe for the Corporation to come out and make its schedule known. The trade had lost confidence in any and all so-called price schedules. Even the United States Steel Corporation price was being allowed to sag in order to hold business. The attempt by independents, earlier in the week, to bolster up the market by withdrawing low figures on sheets could not succeed. There had been so many prices peddled in Canada that the buyers were dizzy, and when the trade arrives at the stage where no one believes that he is getting the best price, then buying is going to be on an ounce-for-ounce basis, covering absolute requirements and no more.

**The Real Effect**

No one is going to put forth the claim that the new schedule will mark the beginning of a buying movement. The Corporation itself could not expect that, otherwise they would have trimmed prices weeks ago. The real benefit is here — that a standard has now been fixed around which the markets and business of the future can be conducted and planned. With that accomplished, a big step has been taken toward bringing about a healthy feeling in the trade, where speculation and guessing have too long had preference over that necessary degree of confidence and certainty, without which the steel markets in general have simply been wandering around in circles.

**Varying Reports**

Trade comes to different warehouses in different volumes. Some of the yards have not done the business they anticipated in boiler tubes, for instance. This is the season when the boiler tube business should still be good. Some of the dealers, on the other hand, claim that

tubes have been among their best business this year. Shafting has also been in demand. There were many months in recent years when it was almost impossible to get shafting, and as a result there was an accumulated demand to look after.

Dealers, when asked what effect the new price would have on bars in the warehouse, stated that there was a general feeling that the price of bars in Toronto warehouses should find a level around four cents per pound. There have been some sales going quite a bit below this figure, and one case was heard of where a sale had gone as low as 3.50. This was on a tonnage that the dealer was anxious to unload, and cannot be regarded as indicating a real market level. Warehouses have been clearing out stocks, and in some cases have been applying mill prices on warehouse stocks.

### The Price of Pig Iron

Following the forcing of the pig iron market in the States down to $25, Canadian makers have placed their price at $34.14. Orders are small, one dealer regarding an order for a car of 50 tons as a pretty good piece of business this week. Canadian makers can hardly stand to make a very big profit at this new price. Some of them have great piles of coal which was brought in at a time when prices were high, and the same can be said of their ore. The price of pig has been steadily reduced. Some of the stacks are piling pig iron in their yards, one company expressing a willingness to do this to the extent of 20,000 tons, before blowing out.

# NEW PRICE OF THE STEEL CORPORATION PUTS END TO THE DOUBLE STEEL MARKET

Special to CANADIAN MACHINERY.

PITTSBURGH, April 21.—The slight advances in steel prices begun by independents, as noted last week, became general among the independents not merely in bars, shapes and plates, which were covered by the first advances made, but also in sheets and wire products. Then the United States Steel Corporation began making reductions, the result being that the Corporation and the independents are again on the same basis. The common expression is that the market is "equalized." Roughly speaking, the advances of the independents represented on an average about one-third, and the reductions of the Corporation about two-thirds of the total gap that had separated the two sets of prices.

Neither the independents nor the Steel Corporation made any formal statements as to the cause or causes of their action. One might assume that the Steel Corporation reduced its prices upon finding that it would not take as much reduction as it formerly would have to equalize the market, or one may assume that the independents made their advances from having information that the Corporation had decided to reduce its prices, and as the Corporation would of course reduce its prices to the lowest levels made by independents it would be good policy on the part of the independents to put their prices up so that the Corporation would not have so far to go.

Practically the whole trade is convinced that the latter is what occurred. The independent advance was too sudden to be a mere matter of chance. It looked decidedly as if the independents had word that the Corporation had set a time when it would reduce its prices and hastened to give the Corporation a higher basis on which to work. That the Corporation did plan the matter a trifle in advance is known from the fact that the advances started with a meeting in New York of the subsidiary company presidents, some of whom had to travel long distances to get to the meeting and had to be notified in advance.

### Price Changes

The price changes in most of the commodities can be shown in a table, as given below. The Industrial Board prices of March 21, 1919, were those of the Steel Corporation until its present reduction. The second column gives the independent prices prior to the adjustment, while the third column gives the prices to which the independents advanced and the Steel Corporation reduced:

| | Industrial Board | Independent | Present |
|---|---|---|---|
| Bars | 2.35 | 1.90–2.00 | 2.10 |
| Shapes | 2.45 | 2.00–2.10 | 2.20 |
| Plates | 2.65 | 1.90–2.10 | 2.20 |
| Black sheets | 4.35 | 3.75 | 4.00 |
| Blue annealed sheets | 3.55 | 2.80–3.00 | 3.10 |

The case of galvanized sheets was different. The Industrial Board price was 5.70c, independents having gone to 4.70c and 4.80c, according to size of order, while they advanced to 5.10c, but the Corporation did not recognize this price, naming instead 5c.

In plain wire there was another difference. The Industrial Board price was 3c, but wire was one of the three or four commodities on which the Corporation made advances in August, 1920, advancing the price to 3.25c. The independents had been quoting 3c and sometimes less, and the Corporation came down to 3c. Nails showed another divergence. They were $3.25 on the Industrial Board schedule, while the independents after going up to $4.25 and higher in 1920 got down to $3 a few weeks ago, and then advanced to $3.25, while the Corporation has reaffirmed that price. Thus nails are the only product remaining on the Industrial Board schedule.

In the products mentioned above the cutting began about February 1. In tubular goods cutting did not appear to any extent until March, and just before the Steel Corporation began making reductions the Steel & Tube Company of America, as noted in last report, made a further cut, making the total about $10 a ton below the Industrial Board or Steel Corporation prices. The independents made no effort to go up from their extreme cut prices, but the Steel Corporation instead of reducing by the same flat amount has made various reductions, which in general may be described as involving five points (a point being approximately $2 a net ton) on sizes 6-inch and under, and four points on sizes 7-inch and over, this applying to standard steel pipe, line pipe and in general to oil country goods. The smaller sizes of standard pipe were reduced less, and ⅛-inch was not reduced at all. Doubtless the independents will now advance on the smaller sizes.

Hoops and bands are reduced by the Steel Corporation from 3.05c to 2.75c. Hot rolled strips are formally quoted by the West Leechburg Steel Company at 2.75c and cold rolled strip at 5.50c.

### Effect of Equalization

The Steel Corporation, as a result of its price adjustment, will doubtless have heavier specifications and more releases against suspended orders, from its regular customers, and its operating rate may increase somewhat from the 40 per cent. or thereabouts to which it has declined, from over 90 per cent. at the beginning of the year. The independents cannot expect to book more business than they were booking in the past few weeks, but it seems they rounded up some business that was hanging fire, when they withdrew their lower quotations. The independents have been operating at about 35 per cent. lately, against 30 per cent. in both January and February. These percentages are higher than have been commonly estimated in the trade. For one reason or another the independent mill operations have been underestimated in trade talk for four months or more, while the figures here given are substantially correct.

### Prospects

When the steel industry is operating at between 35 and 40 per cent. men are naturally disposed to ask "When is it going to operate at 100 per cent?" but that is not altogether a reasonable question, for it assumes offhand that whatever the steel making capacity, it is the function of buyers of steel to give it full employment. Responsibility for the present capacity rests with the war, not with the buyers of steel, the capacity being one-half greater than just before the war, and for several years before the war the capacity had not been fully engaged for more than about half the

time. It would require a collection of favorable conditions that could properly be called abnormal to engage fully a steel making industry that has what is plainly an abnormally large capacity, and the sooner everyone realizes this fact and takes cognizance of it in his calculations the better it will be. In the first nine months of 1920, when there appeared to be heavy demand, the industry operated at only 80 per cent., being restricted by various conditions.

The fair, and really rather hopeful, prediction is that by about next October the production of steel may be about one-half greater than it is now. That would mean a rate of ingot production of about 29,000,000 tons a year, or about the average rate in 1912 and 1913, by far the best tonnage years before the war, but it would be a rate of only 55 per cent. of capacity.

## SINGLE MACHINES IN N. Y. MARKET

**Business There Has Been Done on a Small Basis and Continues in that Way**

Special to Canadian Machinery

NEW YORK, April 21.—The business readjustment proceeds slowly, but there are increasing evidences of a trend in the direction of improvement. The most constructive bit of news in the week was the announcement of the Railroad Labor Board of the abrogation of wage agreements with a part of railroad labor, which possibly will mean a saving of $300,000,000 a year to the transportation companies. On top of this, President Harding's cabinet on Friday considered steps to be taken toward a readjustment of railroad freight rates on a basis that will be conducive to a revival of business. Unquestionably much business is adversely affected by high freight rates. Secretary of Commerce Hoover stated in a public address this week that the freight rate on a bushel of wheat from the Argentine is 10 cents as compared with 30 cents from our own wheat-producing sections of the West to the Atlantic coast.

High money rates have been a deterrent factor in business, and some easing of this situation is noted in the announcement of the Boston Federal Reserve Bank of a reduction in the rediscount rate from 7 to 6 per cent. If other Federal Reserve Banks follow this action soon, there may be money available at 6 per cent. to permit construction work and other investment buying.

Meanwhile, the machine-tool trade is merely marking time. The promise of improvement within the near future which was indicated by the recent increased volume of inquiry has not been fulfilled, nor does the machine-tool trade expect much improvement until the whole business situation has cleared up.

There has been very little new inquiry for tools in the past week. Business is confined almost wholly to single machines, and the smaller manufacturers are more active in buying than the large ones.

## Pig Iron Markets

In the Pittsburgh district the pig iron market is in much the same condition as during the past few weeks, orders being limited to small lots for prompt shipment. No new inquiries of any size have come out. Foundry iron is generally quoted at $25, valley furnace, for No. 2.

Boston reports a sale of 700 tons, comprising four brands of Buffalo and Pennsylvania irons. various silicons, to a southern New England melter, and another of 300 tons Pennsylvania iron to a Connecticut foundry. These lots are resale, prompt shipment iron, and terms private.

Practically no business was done during the week at St. Louis.

The pig iron market at Pittsburgh is flat. Generally, makers of foundry iron are not inclined to go below $25, valley furnace, and one merchant interest reports having turned down 500 tons of this grade carrying a price of less than $26.

On the Chicago market many foundries which have been out of the market for a protracted period are now buying carload lots for spot shipment. Melters are continuing to purchase their needs cautiously.

The market continues dull at New York and the only business of any considerable size which has been talked about has been in connection with the cast iron segments which will be needed for the vehicular tunnel under the Hudson River, between New York and New Jersey.

There is very little activity in the local market at Cincinnati. The principal inquiries are for 1,000 tons of northern foundry iron, and a cast-iron pipe company is reported willing to buy 500 tons, providing prices quoted are satisfactory.

## Scrap Metal Market

Prices on Pittsburgh market are still downward because of the continued lack of consumptive buying, and the fact that dealers with yards do not feel they can safely lay down much material at current prices. The prices quoted in all cases represent what dealers are willing to pay for yard tonnages, and are not a good line on what the steel manufacturers or foundries would have to pay if they were in the market.

Purchases by consumers have practically ceased on the Chicago market except for hand-to-mouth buying of cast scrap. Although mill and blast furnaces have reduced the quotations on their products since the war, old material has declined relatively much further.

Scrap metals have further declined during the past week at New York and new post-war levels have been reached. A railroad which put out a list of about 6,000 tons withdrew it because of the low bids of dealers and brokers.

There has been a small movement of stove plate at $19 on the Buffalo market. Dealers report little activity.

Althought the scrap market at Boston is limited, the market is more active than it has been for several weeks.

## COMPARE NEW AND OLD FIGURES

**Reductions Recently Made In Selling Prices of Various Lines of Steel**

Here are the new prices of the United States Steel Corporation, compared with the old:

| | New Prices | Industrial Board Prices |
|---|---|---|
| 4 x 4-in. and heavier billets, per gross ton | $37 00 | $38 50 |
| Slabs, per gross ton | 38 00 | 41 00 |
| Sheet bars and small billets, per gross ton | 39 00 | 42 00 |
| Bars, per 100 lbs. | 2 10 | 2 35 |
| Plates, per 100 lbs. | 2 20 | 2 65 |
| Structural shapes, per 100 lbs. | 2 20 | 2 45 |
| Wire rods, per gross ton | 48 00 | 52 00 |
| Plain wire, base | 3 00 | 3 00 |
| Wire nails, per keg, base | 3 25 | 3 25 |
| Tin plate, per base box | 6 25 | 7 00 |
| Blue annealed sheets | 3 10 | 3 55 |
| Box annealed, black | 4 00 | 4 35 |
| Galvanized sheets | 5 00 | 5 70 |

## BRANTFORD FIRM TAKES NEW LINE

**Darling Valves Will be Made at Plant of the Dominion Steel Products in Short Time.**

BRANTFORD. — Announcement was made of the taking over by the Dominion Steel Products Co. of the Darling Valve and Manufacturing Co. of Williamsport, Pa. This company makes a line of valves for waterworks, oil lines and other pipes and hydrants, and has a reputation very high in Canada as well as in the United States, where the parent plant is located. Owing to the high duty on their products, which in the United States sell for a higher price than the products of their competitors, the market in Canada was limited, yet despite this they were used considerably, Brantford and Ottawa being among the cities which utilized their goods.

It was reported at the D. S. P. that the company was already receiving business in the new lines. The signing of the contract means that No. 1 and No. 2 plants will be opened for the manufacture of these goods as soon as necessary changes can be made, particularly in the foundry. It will take three or four weeks to bring these changes into effect and to get the plant upon a full production basis.

# SELECTED MARKET QUOTATIONS

**Being a record of prices current on raw and finished material entering into the manufacture of mechanical and general engineering products.**

# INDUSTRIAL NEWS

## NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

## Trade Gossip

**Wants Equipment.**—Fred E. White, 163 Rothesay Ave., St. John, N.B., advises Canadian Machinery that he is in the market for some machine shop equipment. No other particulars were furnished.

**Wants Garage Equipment.** — P. A. Wagner, of Wellesley, Ont., wants some used equipment, as follows: Drill press to operate with power, power hacksaw, several grinders, and a couple of other machines.

**Business Is Good.**—Mr. P. Pocock, of the London Concrete Machinery Co., states that business in their line never was better, and is now away ahead of last year. The war hit this line of trade particularly hard, but it is now experiencing a remarkable recovery.

**Operate in June.**—Engineer Clark, in charge of the construction programme at the C.P.R. creosoting plant at Sherwood, on the outskirts of Sudbury, stated that he expected the plant to be in operation towards the end of June. Some 80 men are employed at the present time, but no more are being taken on. When the plant gets under way over 300 men will be employed.

**Agency Changes.**—The Modern Tool Co. announce arrangements whereby the E. L. Essley Machinery Co., 551-557 Washington Blvd., Chicago, Ill., become exclusive selling agents in Chicago territory for Modern and Universal grinding machines. In addition to a large sales force working from the Chicago headquarters it has branches in Milwaukee, Wis., and Moline, Ill. The Modern Tool Co. will also have their own grinding expert stationed at the Essley headquarters.

**A Busy Place.**—The National Steel Car Company, of Hamilton, has orders on its books involving an aggregate of $14,000,000. The company is operating at capacity in its rolling stock department and is also busy in the manufacture of motor trucks. The potential requirements of cars for the Canadian railways give the car builders of the Dominion a favorable outlook for the future, and the volume of orders held by the National Car Co. gives assurance of active operations for the next few months.

**Buying More Equipment.** — Assured that the debenture issue for the city's railway, the London & Port Stanley, will be approved by the Provincial Legislature, Vice-Chairman Philip Pocock announced the programme that will be put into effect as soon as the City of London Bill has received the Legislature's sanction. A new electric engine will be purchased and put into use for the summer excursion traffic, at least six new cars are to be added to the road's rolling stock, and the L. & P. S. shops are to be enlarged.

**Business Is Better.**—The Perfect Machine Co., Galt, Ont., informed Canadian Machinery that business, as far as they were concerned, was on the upgrade. They have had quite a few nice orders lately, and have good prospects of others in the near future. They are bringing out a new 18-inch drill press of the upright type, to be known as their No. 19 drill. This machine will be equipped with power feed and back geared. The design is being kept as simple as possible, all non-essentials being eliminated.

**No Depression.** — That Peterborough industries have not suffered as have those of many other cities during the present period of depression is indicated

## MEN WERE GIVEN ACCESS TO THE BOOKS AND RECORDS OF COMPANY

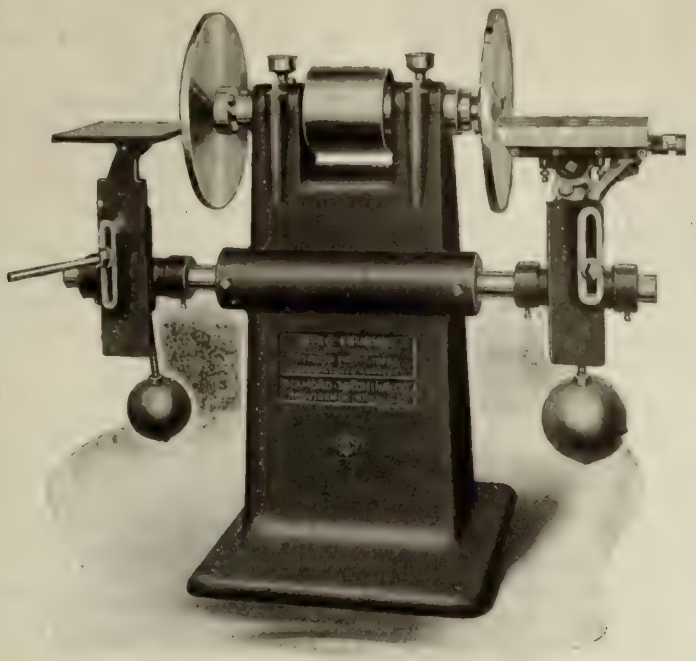
HAMILTON.—The Industrial Council of the International Harvester Co. has been called upon to fix the wages of the plant, about as severe a test as could be put on the organization.

On Friday of last week bulletins containing the report of the works council of the International Harvester works on the question of wage reduction were posted in the various departments of the big plant here. The report was issued yesterday, and is said to be the unanimous finding of the council, which consists of eight representatives of the employees, elected by the workers in the different departments, and an equal number of representatives of the company. The workers' representatives spent five full days in investigating the company's books concerning cost production, orders and other matters, and went into the wage returns of all the employees. As a result, the members reported, among other things, that:

"We, the employee representatives, find that owing to the lack of orders on account of the high cost of machines and large stock on hand, the company's proposed reduction of 20 per cent. on day and piece rates, and 10 per cent. on salaries, seems necessary, and wish to go on record as regretfully accepting same in hope that the plant may be kept running.

"After carefully reviewing the reductions made so far, and the further reductions necessary to meet the objective asked for, and having tried in every way, without success, to find some other way of accomplishing the result, we endorse the present method of reducing the day and piece work rates in force November, 1920, until a total reduction of 20 per cent. is reached."

The wage reductions made so far by the company on the November scale average 13½ per cent., and according to the finding of the council the company is warranted in making a further cut amounting to 6½ per cent.



The council presented its report to F. J. Gernandt, the local superintendent, who expressed satisfaction at the finding, which he believed would be the means of averting a shutdown of the plant and turning over 1,500 hands out of work.

The works council of the Oliver Plow Works, a subsidiary of the International Harvester Company, is now preparing a report.

### Report Well Received

It is stated the finding of the council has been well received by a majority of the hands employed at the Harvester works, and will be the means of steadying the labor market, it is thought, by many other workers.

An explanation in regard to the 10 per cent. cut in the price of the company's products not taking place till next year was made by an officer, to the effect that the product marketed this year was made up months ago, with wages and material at the top price.

# DIAMOND
## DISC GRINDERS

Good grinding in fast time has made the Diamond popular in a host of shops. The right design and build eliminate vibration and give the operator a perfect surface every time. There is a suitable size and equipment for every surface grinding job you have. Workmanship and material of "Diamond" quality throughout.

May we send you catalogue?

*If interested tear out this page and place with letters to be answered.*

by the exceptionally heavy freight shipments from this city since the first of the year, according to A. McNab, local agent for the Grand Trunk. The Peterborough Cereal, Canadian Packing, De Laval, Peterborough Milk Products and Canadian General Electric Company have maintained particularly steady shipments, Mr. McNab said. Outside of the textile industry depression has not been noticed locally this winter.

**Fosdick Announcement.**—The Fosdick Machine Tool Company, of Cincinnati, Ohio, makers of heavy duty radial drills and upright drills, have taken over all patents, drawings, patterns, jigs and fixtures covering the line of Pierle quick change, high speed, ball bearing, sensitive drill presses, from the R. K. Le Blond Machine Tool Co. This acquisition by the Fosdick Machine Tool Co. will give them a complete line of drilling machinery consisting of heavy duty radial drills, heavy duty upright drills and gang drills, and high speed sensitive single and multiple spindle drills.

**Make Metal Signs.**—Announcement is made of the reorganization of the St. Thomas Metal Signs, Ltd., under a Dominion charter for $100,000 capitalization, with F. W. Sutherland, president of the Sutherland Press, Ltd., named as president and treasurer of the new company and James T. Stewart of Springfield, Ohio, vice-president and general manager. Plans for the future development of the concern, which is the only one of the kind in Canada, are already under way and include the erection of a new factory building. The old company was formed two years ago and during that time has manufactured nearly $300,000 worth of metal signs.

**Report Favorable.**—A favorable report has been submitted by the engineers investigating the prospects for the manufacture of steel on the British Columbia coast by British industrial interests. It is several months since the announcement was made of the incorporation of the Coast Range Steel Company with a heavy authorized capitalization. It is understood that the investigators have advised the British capitalists that all the materials and facilities necessary for the manufacture of steel on a large scale are available, including hematite, magnetite, coal, and the various fluxes. An announcement as to preparations for manufacture is expected from the Britishers who are interested in the venture.

**New Plant in Galt.**—Speaking to Canadian Machinery relative to their new plant, the High Speed Tool Co., Galt, Ont., stated they hope to commence operations within a week. They will produce a full line of high speed tools such as taps, dies and gauges, also cater to work on special forming and blanking dies, jigs and fixtures. They intend specializing on their line of thread gauges, and speaking of the method of heat treatment they will employ, they stated it is an entirely new method in this country. It is said to be a process that is particularly applicable to tools such as taps, etc., where scale is not permissible. Electric furnaces will be used for heating.

**Will Extend Plant.**—Plans are under way for extensions to the John Inglis Co. plant, Toronto. Wm. Inglis, speaking to a representative of this paper this week, said the biggest part of their business at the present time was repair work, which showed that many firms are in need of new equipment. Mr. Inglis felt that an adjustment of the wage question and a restoration of the public confidence in the matter of steel and other raw materials would go far toward re-establishing business on a firmer basis. His organization is spending $75,000 on improvements for their machine shop, boiler room, foundry and on the plant generally. This, said Mr. Inglis, shows what faith they have in the future. Mr. Inglis said they had been negotiating for some time for the purchase from the city of some land directly across the road from their present site, and that he hoped to be in a position to close this deal and proceed with the building of a new foundry without further delay. Mr. Inglis left the city on Friday on a business trip to Chicago.

---

W. L. Jepson, of Niagara Falls, was at a special meeting of the city council appointed city engineer at a salary of $3,000, his duties to commence immediately. D. H. Fleming, of Owen Sound, had been appointed, but his resignation was not accepted by the Owen Sound council.

## SHORT TRADE NOTES

E. W. Brocklebank, Arthur, Ont., is in the market for a 60 to 85 horsepower steam boiler and 50 to 75 horsepower engine.

The Hall Zryd Foundry Co., Ltd., Hespeler, Ont., is in the market for several motors, second-hand preferred, of 15 to 30 horsepower, 550 volts, 25 cycle, three phase, 750 r.p.m.

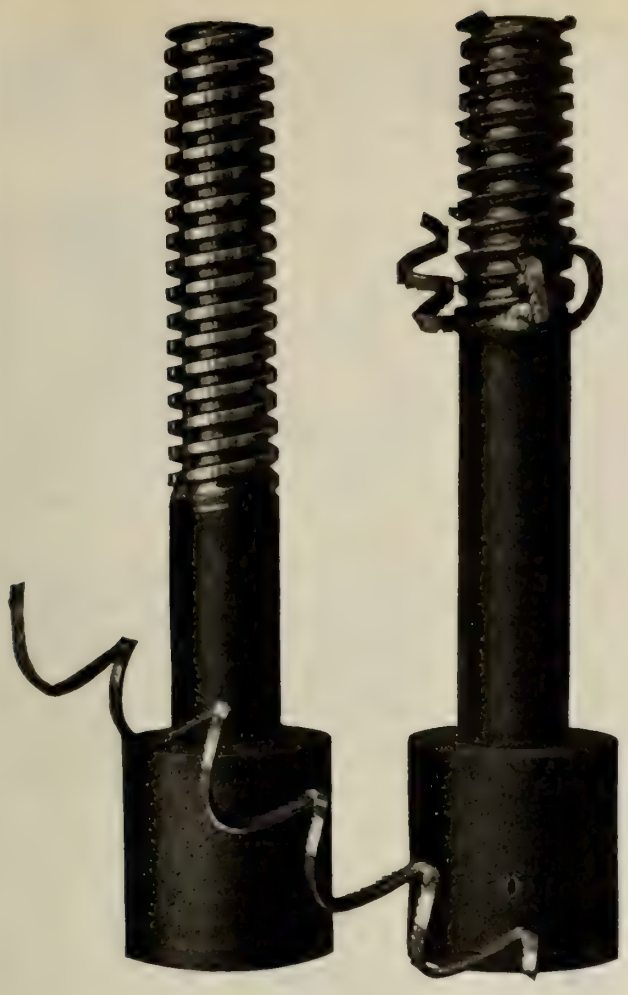
Fire, March 28, at the plant of the Record Foundry & Machine Co., Moncton, N.B., damaged the warehouse and shops to the extent of $70,000. Rebuilding will start immediately.

The Corundo Steel Co., Ltd., has acquired the plant of the Record Foundry & Machine Co., 17 Mill Street, Montreal, for the manufacture of cutting and percussion tools from low grade steel by a special chemical heat treating process. Oscar Schenck is managing director.

Two new industries, the Fuller Brush Co., Hartford, Conn., and the Coffield Washer Co., will establish plants in Hamilton, Ont., according to C. W. Kirkpatrick, industrial commissioner. The Coffield Washer Co., which has just been incorporated, will manufacture a new type of electric washing machine and will erect a factory.

The General Forgings & Stampings, Ltd., Merritton, Ont., has been incorporated with a capital stock of $900,000 by William S. Morlock, 107 Roxborough Street West; Sydney E. Wedd, 85 Bay Street; Roy B. Whitehead and others, all of Toronto, as provisional directors, to take over as a going concern the plant and business now being carried on by the General Forgings & Stampings, Ltd.

# BLAME LACK OF PROTECTION FOR CLOSING OF PLANT AT LONGUEUIL



It is understood that Armstrong, Whitworth of Canada, Ltd., are contemplating closing down their works at Longueuil.

On behalf of the management it is stated that owing to the failure of the Dominion Government to give them any tariff protection on the manufacture of locomotive steel tires they closed down their tire mill some twelve months ago, and will not reopen their mills again until such protection is given. Most of the raw materials they require have to be brought from the United States and are dutiable. No protection, however, is afforded them under the Dominion tariff for their finished product. This tire mill is the only one in Canada. Messrs. Sir W. G. Armstrong, Whitworth & Co., Ltd., the famous engineers and shipbuilders of England, commenced building these works in 1914, and installed all the latest machinery. Owing to the outbreak of the European war, it was difficult for them to supply the necessary technical operators from their own works in England.

About six months ago they sent D. E. Grant to go into the situation and after being in London for some weeks he has just returned to Canada.

Armstrong, Whitworth & Co. of Canada, Ltd., will carry on their agency work on behalf of the parent firm, and the firms who are allied with them, and will continue to dispose of their stock of small tools and tool steel, water turbines, dock machinery and such like, including the Armstrong Siddeley motor car.

If this business develops as they anticipate, they intend to consider seriously the establishment of such a plant in Canada. They are already discussing some large propositions for the development of Canadian resources.

# It Was Just A Matter of Grinding

The same set of Thread Chasers cut these two threads.

Observe what a clean cut the Chasers gave on this open hearth stock after they had been correctly ground. Note how neatly the Chasers curled out the chip. Before given the right form of grind, the Chasers simply pushed out the stock.

# How To Grind Thread Chasers

**Instructions for the Care of Thread Chasers are very completely given in a 27-page booklet published by us.**

# The Book Is Free

To those having the care of Thread Chasers.

It is printed and distributed with the hope that the rules given will be followed, and if they are, it will be the means of an inestimable saving of time, money and trouble.

If you have anything to do with the care of Thread Chasers, ask us for the book. Although there is no charge for the book, it is full of value. It will cost you the price of a postage stamp only, and will save you trouble, increase your value to your employer and save a lot of money that is needlessly wasted in time and scrapped work.

# MONTREAL NOTES

Rumors that were prevalent some months ago regarding a large match factory that was to be built in Canada by British manufacturers seem now to be on the point of consummation, as it is stated that Sir Alexander Maguire, of the firm of Maguire, Patterson and Palmer, will shortly come to Montreal to negotiate for the erection of the necessary factories in this district.

* * *

The "Canadian Commander" and the "Canadian Leader," the last two ships constructed by the Canadian Vickers Company for the C. G. M. M., are just about completed and will undergo their final tests by the builders this week, before being handed over to the owners. The first named will be placed on the India and Far East service, under the command of Capt. M. Robertson, while the Leader will be in charge of Capt. J. D. Mackenzie and will make her maiden voyage to Australia and New Zealand by way of the Panama Canal.

* * *

At a recent luncheon of the Co-operative Electrical Society, J. D. P. Coats, of the Marconi Wireless Company, gave a short address on the subject of wireless 'graph and 'phone, accompanied by practical demonstrations. An interesting feature of the meeting was the listening to a concert being given at the plant of the company many blocks away. Mr. Coats stated that similar concerts were given at the Montreal plant every Tuesday night, and these were enjoyed by a large number of amateur wireless operators throughout Eastern Canada.

* * *

Efforts are being made by the Canadian Workers' Federation of Returned Soldiers and Sailors to hold a mass meeting in Montreal shortly, at which the Hon. C. C. Ballantyne will be asked to preside. At a recent interview with the Minister in Ottawa, a deputation of the workers received his promise to give consideration to the matter of providing work for this class of worker, but could make no definite statement as to the shipbuilding program of the Government. In stating their requests to the Minister it was asked that should contracts be awarded by the Government for the construction of new vessels that favorable consideration be given to Montreal as the place of construction.

* * *

Announcement has been made by the Marconi Wireless Company of Canada that they are constantly receiving messages at their Common Street station in Montreal, direct from Clifton, Ireland. It is only recently that such messages have come through without relay, and this achievement emphasizes the progress this company is making in the development of wireless apparatus. This local station was erected primarily for experimental purposes for the study of static conditions, so that it is with no small degree of satisfaction that equipment has been produced to receive and record uninterrupted messages over this great distance. Direct communication between Montreal and the Continent seems an early possibility.

* * *

Joliette Castings and Forgings, Ltd., of Joliette, Quebec, have recently completed the installation of a one-ton Greaves-Etchells electric furnace for the manufacture of manganese steel and alloy steel castings, particularly for the making of wearing parts for mining machinery. They have likewise installed a new five-ton Northern Electric travelling crane in the new building and extended the cleaning shop 100 feet, with a width of 40 feet, in which is installed a new continuous car annealing furnace and a complete oil storage and pumping system. They have also built a new sand blast house equipped with Pangborn sand blast. A new power house and machine shop has been erected with the necessary machinery for facilitating delivery of finished castings and specialties.

## PLANT WILL HAVE GREATER CAPACITY

**Changes Being Made To Give Larger Output for Electrical Apparatus.**

Owing to the substantial development that has taken place in the electrical equipment business of the Canadian General Electric, it has been found necessary to take over some of the space that has formerly been included in the Allis-Chalmers plant.

This will be utilized after the necessary equipment has been secured, some of which will be taken from other plants, for the making of transformers.

Mr. J. J. Ashworth, general manager of the Canadian General Electric, intimated that it would take some time to finish making the change, but that when completed the plant would be capable of much greater production of electrical equipment.

The plans of the company also call for the disposal of a large amount of used machinery, part of which was used in their war contracts.

---

From 125 to 130 different weights of metal lath were in common use a short time ago. Through a conference with the Bureau of Standards, it now appears, manufacturers have agreed to reduce the number of weights of metal lath to three.

## CHANCES TO MAKE NEW CONNECTIONS

**Some of These Lines May Come Within the Scope of Output of Your Factory**

Canadian firms interested in any of these items should write Canadian Machinery for particulars, mentioning the number in each case.

2858. A London firm desires the addresses of Canadian producers of cobalt ores.

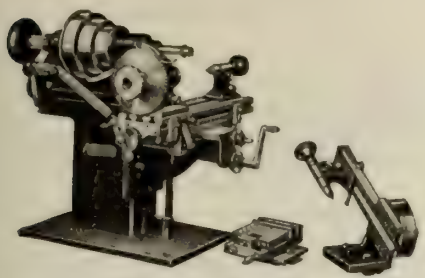
2856. **Belt dressing.** — A Manchester firm wishes to place on the Canadian market a new solid non-slip belt dressing and are prepared to appoint agents in Montreal, Toronto, Winnipeg and Vancouver.

2857. **Electrical supplies.** — A Manchester firm would like to hear from any Canadian manufacturers of electrical goods (specialties in particular) likely to be saleable in the United Kingdom.

2907. **Asbestos, leather belting, electrical material and other technical articles.**—A Milanese house is anxious to open up correspondence with Canadian firms.

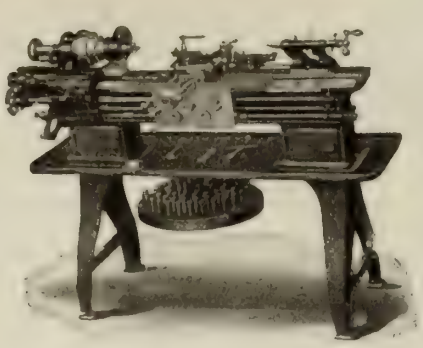
2908. **Machinery, rubber goods.** — A firm in Milan would like to establish relations with Canadian firms exporting machinery and rubber goods.

2913. **Hardware and metals.**—A firm in Belgrade, Jugoslavia, would be interested to hear from Canadian exporters of hardware, iron and steel and other metal lines and agricultural implements.



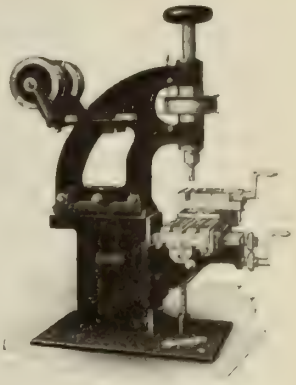
2904. **Industrial and agricultural machinery, safes, etc.** — A Sicilian firm would be glad to hear from Canadian houses dealing in industrial and agricultural machinery, safes, etc. The firm is also disposed to represent Canadian firms.

## Personal



The marriage took place at Kingston, at the home of the bride, Alwington, of Miss Mabel Ford Richardson, youngest daughter of the late Senator Henry W. Richardson, and Henry Graham Bertram, of Dundas, Ontario. The groom is chief engineer of the John Bertram and Co. works in Dundas.

At a meeting of the directors of the Stanley Steel Co., Hamilton, held this week, Lt.-Col. Harry Hatch was elected vice-president and general manager of the concern. Col. Hatch graduated in mechanical engineering from Queen's University. Previous to the war he was purchasing agent for the Canada Steel Goods Co., of which his father is president. He served with distinction with the 19th battalion in the great world war. On his return he was made assistant superintendent of the Stanley Steel Works at New Britain, Conn. His latest promotion is a most important one for a young man and he will receive many congratulations.



# METAL and WOODWORKING MACHINERY of all Kinds

Cataract Quich Change Swing Precision Lathe, with Motor Drive.

Cataract R-4 Double Bench Unit with Under-Drive.
(Details in No. 15 Catalogue.)

The equipment shown above being self-contained, is particularly well adapted for tool room work, the manufacturing of duplicate parts, or for optical and jewelry manufacturers and all precision work.

G&W MACHINERY

## GARLOCK-WALKER MACHINERY CO. LIMITED

32 FRONT ST. WEST, **TORONTO** TELEPHONE MAIN 5346

# STANDARDIZING PARTS OF FARM MACHINERY IS BEING UNDERTAKEN

OTTAWA.—A. B. McCoig, member for West Kent, has made some progress with his plan for having parts of agricultural implements standardized in Canada, so that it will be easy for farmers everywhere in Canada to get repairs. The sub-committee was named by the agricultural implement manufacturers and was informed by the latter of various difficulties in the way of standardization, but it was agreed that in some respects the scheme was feasible.

Samples were submitted of ledger plates, sections and guards, as well as parts of cutting-bar by the Massey-Harris and International Harvester companies, and parts of plow-points and plow-point bolts by the Cockshutt and Verity Plow companies.

### Speak for Makers

The representatives of manufacturers present were as follows: A. W. Wallace, International Harvester Co.; George D. Graham, Frost and Wood Co.; T. Whitecomb, Smith's Falls; W. S. McFarlane, Cockshutt Plow Co.; W. A. Watts, Massey-Harris Co.; E. F. Bolte, A. L. Upton, International Harvester Co.; Wm. J. Verity, Verity Plow Co.; Messrs. George Valentine, T. Bradshaw and J. G. Hossack, of the Massey-Harris Co.

The sub-committee who met them were the chairman of the agricultural committee, Mr. R. C. Henders, and Messrs. McCoig, Harold, Wright, Nicholson and Dr. J. H. Grisdale, Deputy Minister.

Representatives of the manufacturers argued that to standardize these different parts would be to create a new group of articles which would add to the burden of local agents in the way of repairs to be carried, and also that it would interfere with the improvement of different machines or implements affected. After further parley, however, it was conceded that very material progress might be made toward standardization in the following cases:

### Five Special Cases

Ledger plates, as to shape and attachments.

Sections, as to location of rivet holes.

Plow-points, as to location of bolt holes and shape of same.

Plow-point bolts, as to shape.

Sprockets and sprocket chains, nuts for wagon skeins, and nuts and bolts generally.

At a subsequent meeting among themselves, the representatives of the manufacturers passed the following resolution:

"That the representatives of the implement companies present at the meeting of the agricultural committee are of opinion that a measure of standardization is possible on many of the articles considered and discussed with your sub-committee this morning. It will, however, be recognized that any change, even of a minor character, which may be made in agricultural implements may involve important manufacturing considerations, and therefore it is suggested that a board composed of expert engineers, to be named by your committee, and representatives of agricultural implement manufacturers, be constituted to investigate and make recommendations."

This was approved by the sub-committee and was embodied in the report to the main committee, which so reported to Parliament.

# BIG RECOVERY IN MICHIGAN PLANTS

**Steadily Moving Toward a Period of Normal Production—What Figures Say.**

Detroit.—According to compiled statements by secretaries of more than a score of Michigan cities, the State's industries show a recovery of 47 per cent. from the low ebb of the readjustment depression during the first two months of the year in the number of workers actually employed.

The improvement which set in about the middle of the first quarter of the year has gradually gained momentum until leaders in all parts of the State foresee steady progress toward normality, even though that goal is not yet in sight.

Figures compiled in the larger cities of the State indicate that their normal working forces aggregate 404,900, while at the low ebb of depression they had been reduced to 122,940. The number of men at present employed in these cities is 235,140.

### SIGNS OF PROGRESS

The contract for the plant to be erected this spring at Brandon, Man., for the Imperial Oil, Ltd., at a cost of $225,000, has not yet been let. The warehouse will be 50 by 200 feet and will be of reinforced concrete. A boiler house, which will be separate from the warehouse, will be 20 feet by 30 feet and the garage 40 by 50 feet. Local manager, D. S. L. Patterson.

The million-dollar concentrator of the Britannia Mining and Smelting Co., Ltd., Britannia Beach, B.C., which was recently destroyed by fire, will be rebuilt. General manager, E. J. Donahue.

The erection of a temporary station in the South Ward, near Queen Street, Kitchener, Ont., is contemplated by the Grand Trunk Railway.

Estimates are being prepared for the new arena and ice plant to be erected at Ottawa shortly. The arena will be situated at the corner of King Edward Avenue and York Street and will have a cold storage plant in connection with it.

# MACHINERY TRADE DULL IN GERMANY

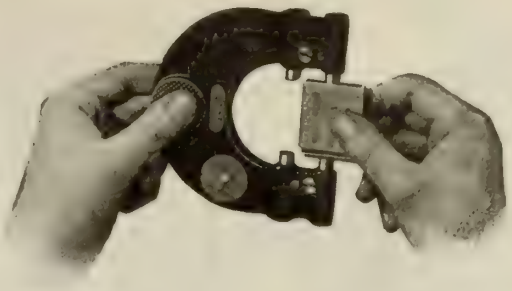
**New Political Conditions Cause Some Uncertainty Regarding Operations of Future**

**Berlin, Germany.** — The machinery trade reports declining business. The political situation has added weight to a situation that was already bad. Foreign buyers are holding off, because they want to see whether Germany can produce successfully under the changed political conditions just forced upon Germany. It goes without saying that home buyers are also placing few orders in view of the uncertainties of the outlook. There is some inquiry for heavy machine tools; buying, however, is light. Locomotive shops have recently taken orders for about 80 locomotives for Spanish railroads, and last month it was announced that the Soviet government had arranged for 1,000 locomotives in Germany, of which 100 would be built at once. These orders were to be distributed among 19 shops. At the same time it was published that in a foreign competition for locomotive parts for Russia, German shops secured 80 per cent. of the contracts.

The German machinery trade has just organized a working council, composed equally of employers and workmen, whose object is to promote harmony in the relations of the two parties. It will also seek to reduce the costs of production through standardization and specialization of product.

# LARGE SUPPLIES OF WAR MATERIAL

**Thousands of Tons of Forging Billets Have Never Been Cleared Out of Stock**



Prices to be asked by the Bureau of Supplies and Accounts, Navy Department, for the 20,000 tons of surplus steel it is to offer in the open market will be fixed at 10 per cent. less than the United States Steel Corporation bases, it is understood. Work of completing the catalogue listing the steel, most of which consists of forging billets, will be completed in about ten days. Other material in the list is comprised of plates and shapes, medium high tensile and galvanized; bars in cold-rolled, medium black and nickel, and billets, blooms and slabs, including mild steel and steel in carbon and nickel. In case the Steel Corporation prices should be changed, it is believed that the bureau would readjust its scale so as to be 10 per cent. under the prices of the Corporation.

Tonnage at Gulf and Atlantic coast navy yards will take no addition for freight, while that on the Pacific coast will carry a freight rate of 88¾ cents, based on the Government bill of lading taking a deduction of 33 1-3 per cent. under the commercial rate of $1.33.

Aikenhead's

*"Everything in Tools"*

The reputation of a manufacturer's product is his greatest asset. The firm which represents him to the purchaser must have a reputation equal to his own. Aikenhead's is the Canadian headquarters of many makers of the world's finest tools.

# Johansson
## Snap Gauges

The adoption of Johansson Gauges all over the world is due to two great factors—**they make short cuts in production** and **cut manufacturing costs.**

You will find Johansson Gauges are considered as essential shop equipment in those shops where economy and efficiency are carefully studied.

Johansson Adjustable Limit Snap Gauges eliminate the cost of making and maintaining solid snaps. They eliminate the tendency of the operator to work to "absolute dimension" and get results even in the hands of unskilled operators.

The Johansson book tells all about them. Write for your copy to-day.

## Single Spindle Hand Tachometers

Hand Tachometers supply the need for accurate, durable and handy speed recorders for all-round use. They indicate accurately the revolutions per minute, either right or left hand, of shafts and spindles; furthermore, by using the measuring disc, periphery or surface speeds are determined. The result (either revolutions per minute or feet per minute) is instantly shown on the dial without watch-timing or calculating of any sort. The slightest variation in speed occurring during a fraction of a minute is also shown at a glance. Belt slipping and consequent loss of power is, therefore, quickly detected.

# MUST CONSIDER THE SEVEN "M'S" OF INDUSTRY TO MAKE A SUCCESS

SPEAKING before the Pittsburgh section of the Industrial Cost Association, on March 8, 1921, W. E. Hundley brought out some worth-while facts on "Production Costs."

When we get a good general view of the big basic sources of cost, we find that the manufacturing and marketing of an industrial product involves seven fundamental factors each spelled with an "M," which might appropriately be called "the seven Ms of industry." They are Money, Millsite, Mill, Machinery, Material, Men, Management.

Each of these factors is the primary cause of certain expenditures which begin as soon as an enterprise is launched and continue as long as it exists. It is no more difficult for a capable cost accountant to classify expenditures with respect to these causes than it is for the naturalist to tell from the characteristics of a leaf the kind of tree on which it grew. They may be readily classified into three main groups: Administration, Production, Distribution.

Money, the motive-power of industry, is obtained primarily by financing the enterprise. It represents wealth accumulated by men willing to risk the loss of it by exchanging it for pieces of paper which entitle them to participate, under certain conditions, in the profits which they feel assured will be earned by the venture, and which they believe will exceed the ordinary rate of interest afforded by other investments involving little or no risk.

### What the Return on Investment Is

This return, which they expect to receive on their investment, is a combination of interest for the use of their money and profit for conducting the enterprise, which should be in proportion to the risk involved and cannot reasonably be expected to approximate a fixed rate for all industries. This matter of interest and profit bears upon the problem, as it is still the storm center among professional cost accountants and engineers, many of whom contend that interest on investment must be included in determining cost of production, reasoning that an enterprise must pay for the use of capital before it can show a profit.

Millsite is not, of itself, the source of much expense, and has very little effect upon cost of production. Money spent for a millsite constitutes a permanent investment which can neither be depreciated nor appreciated, and on which no direct profit can be realized except through rental or sale. Taxes and maintenance are apportioned to production on the basis of space occupied by each department or building.

Mill constitutes an important element of investment which is slowly absorbed into cost of production through the medium of depreciation charges. It also is the source of certain expenditures which may readily be classified as "building expense," and apportioned on the basis of available floor space or cubic contents.

### The Most Important Item of Investment

Machinery embraces all mill equipment directly or indirectly connected with manufacturing, is the most important element of invested capital and the source of most trouble for the industrial executive, the cost accountant and the income tax examiner, in determining cost of production. It used to be difficult to persuade manufacturers that depreciation of machinery and equipment constituted an important element of cost. Now they not only swallow depreciation but hunger and thirst for amortization, obsolescence and inadequacy.

It is most important to know the actual valuation of plant equipment; the value in use. Depreciation allowances charged into cost from year to year are merely accounting estimates and cannot be depended upon as an indication of actual depreciation. Unless the reserves set up have been properly handled the balance when deducted from the book value of the assets may show a valuation that cannot be reconciled with the actual physical condition of the equipment.

Assuming a reasonably accurate cost for machinery and equipment, we have a basis for determining the charges to be made to cost of production for the gradual wear and tear which will eventually cause the scrapping or disposal of such property, regardless of how much may be spent for repairs and maintenance. But the extent to which the repairing of machinery tends to prolong its useful life is an important consideration.

### Distributing Machinery Expenses

Machinery is a constant source of expense, whether idle or operating. Idle machine expense includes the items usually referred to as fixed charges, such as depreciation, insurance, taxes, space charges, small maintenance charges. Operating machine expense covers all of the above charges plus the following, which vary more or less with production: wages of operator, indirect labor, labor expense, power, tools, supplies, maintenance and repairs, crane service, miscellaneous works expense.

Material is generally considered an easy matter to dispose of, chiefly because the tendency is to ignore most of the expenses incurred in connection with it, absorbing them as part of the "general manufacturing expense." As in the case of labor, we have both direct and indirect material costs.

Special expenses in connection with material bought for a particular job should be charged direct to the shop

RATES FOR CLASSIFIED ADVERTISING

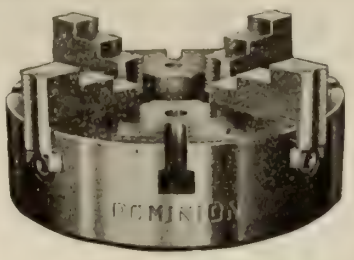
Rates (payable in advance): Two cents per word. Count five words when box number is required. Each figure counts as one word. Minimum order $1.00. Display rates on application.

order covering it, and in some cases charges for demurrage, inspection, testing, etc., might be charged direct to a department. Otherwise, indirect material cost should be distributed on some equitable basis that would take account of weight, bulk. etc.

### Handling the Human Element

Men not only constitute the greatest problem in the industrial world, but are the direct source of so many expenses that cost accountants, as a rule, have used what they call "productive wages" and "productive hours" as an arbitrary basis for distributing all manufacturing expense. Such items as power, tools, supplies, repairs, etc., cannot be thrown into a melting pot called "burden," and distributed to production on a basis of wages or labor hours, if we are to get anything approximating actual costs. But we can and should analyze wages and the expenses incurred in connection with the employment and handling of men and classify them into groups.

Management affects administration, production and distribution but it presents no particular difficulties except in connection with production. Management of production involves a certain class of expenses which are variously referred to as "general manufacturing expense," "plant administration," etc. As a rule these expenses cannot be applied as direct charges to productive processes or operations, but there is one element that is frequently separated and handled as a productive department. Engineering and drafting can and should be handled on an hourly basis, each shop order or department being charged with the direct time of engineers and draftsmen, as reported daily, and a cost rate established to absorb all salaries and expenses.



## CUTTING PRICES TO HELP TRADE

### Following Action of Steel Corporation, Action Is Taken By Some Large Firms

Chicago.—Basing its action upon the recent reduction in steel prices announced by the United States Steel Corporation, the International Harvester Co. announced a straight 10 per cent. reduction effective next year, on products in which steel is the principal raw material.

"The reduction on steel came after one year's product had been provided for, and will have no bearing on the cost of machines we sell this year," the announcement explained.

The company announced reductions of from 10 to 15 per cent. in machines made principally of wood and iron on March 7. The announcement of the more recent cut said that the new changes cover all machines not affected by the March 7 cut.

DOMINION CHUCKS

STEEL OR CAST-IRON BODY
BUILT FOR HEAVY DUTY

All Screws Are Reversible

SCREWS are made of the best grade steel. Both ends are broached and are heat treated after machining. They are reversible, so that either end may be used, are large enough in diameter to stand the torsional strains applied by operator when setting up his work. # Special Machinery Manufacturers

We have frequent requests from manufacturers in the United States for information regarding Canadian firms who are equipped to manufacture their line.

We would like to receive, therefore, the names of any firms who might be interested in inquiries of this kind. We desire the following information:

Name of firm and full address.

Description of shop and equipment.

Particulars regarding regular line, if any.

Class of work interested in securing and best equipped to handle.

Foundry equipment or connection.

This information will be filed and other necessary particulars forwarded to American manufacturers who are likely to be interested.

**CANADIAN MACHINERY**

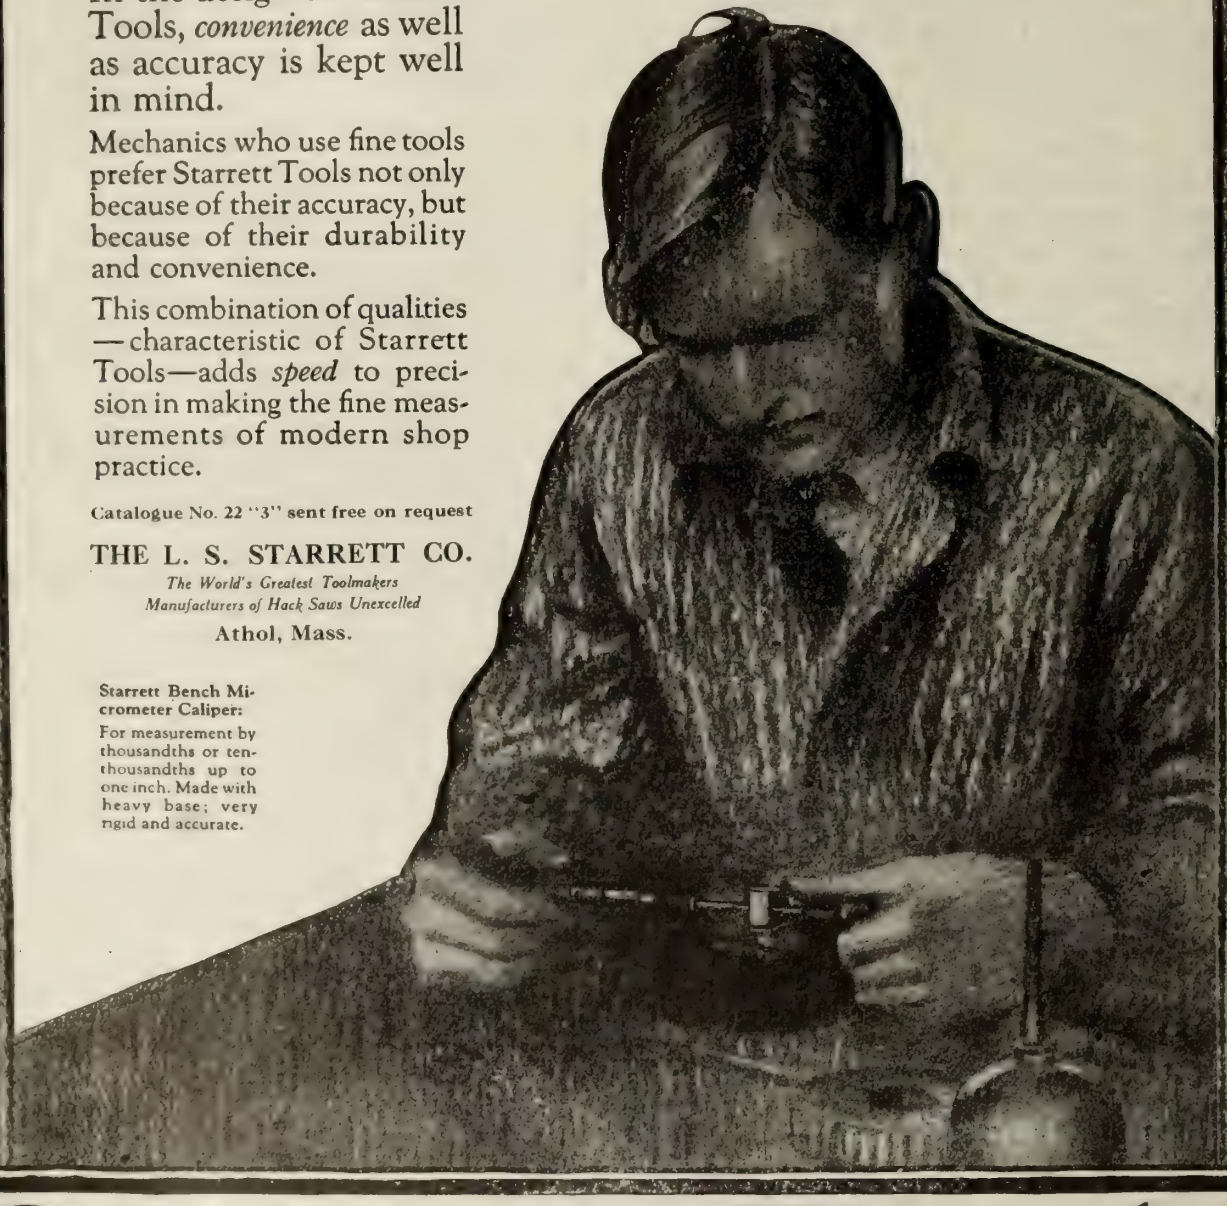
**143 University Ave. TORONTO**

# Speed PLUS Precision

In the design of Starrett Tools, *convenience* as well as accuracy is kept well in mind.

Mechanics who use fine tools prefer Starrett Tools not only because of their accuracy, but because of their durability and convenience.

This combination of qualities—characteristic of Starrett Tools—adds *speed* to precision in making the fine measurements of modern shop practice.



Catalogue No. 22 "3" sent free on request

THE L. S. STARRETT CO.

*The World's Greatest Toolmakers*
*Manufacturers of Hack Saws Unexcelled*

Athol, Mass.

**Starrett Bench Micrometer Caliper:**
For measurement by thousandths or ten-thousandths up to one inch. Made with heavy base; very rigid and accurate.

# IMCO TOOLS

## SPEED!

Tools capable of exceptional speed are a vital necessity to present day production. They must be capable of giving satisfaction on exacting work—even when that work is extremely urgent and *must* be rushed.

The precision possible with "Imco" Tools on speed work will convince you that they should be used on ALL your work. Try them!

# KEMPSMITH

## No. 2 PLAIN MAXIMILLER

Kempsmith Millers are built in three sizes each in the Plain and Universal Cone Types, two sizes of Maximiller Geared Head Types, a Production Type, with a choice of three table ranges, and two sizes of Vertical Geared Head Type. Our Knee Type Millers can be fitted with a complete line of attachments, which greatly increases the range of the milling machine.

***Literature will be gladly sent upon request.***

## Desmond-Huntington Dressers

For use on the largest and hardest grinding wheels and where quick action is desired the Desmond-Huntington is the best Dresser made. It is made in the usual Huntington form, but larger and heavier. It is filling a long-felt want to those who do not find the ordinary size Huntington Cutter efficient or durable, but who prefer a cutter of that type.

We also manufacture the ordinary Huntington Dresser and Cutter. All of our cutters are made from high-grade steel and are carefully hardened and tempered to secure that grade of hardness and toughness that will give the very best results.

SHEPARD
ELECTRIC CRANES & HOISTS

## A "Shepard" aids systematic assembly

Not only in the automotive industry, but in any industry systematic assembly is essential to maximum production.

Shepard Electric Hoists, cage and floor controlled types, are playing an important part in keeping the product "on the move" in many industries.

Let Shepard Engineers work with you in planning an economical and efficient system of inter-department transportation. Their services are extended without obligation on your part.

The Shepard line includes Electric Hoists of ½ to 30 tons capacity; Electric Traveling Cranes 1 to 50 tons; and cargo handling equipment for docks and ships.

# TOOL GRINDING CHART

Showing clearance and rake angles for cutting tools. 17 x 27½ inches, printed in two colors on heavy manilla stock.

A splendid thing for any tool room. One large engineering firm, in acknowledging this chart, stated that they would like two additional copies as they intended adopting it as standard in their tool room.

We would like these charts placed in every shop in the Dominion and if there is not one in YOUR tool room, write for your copy at once. IT'S FREE.

CANADIAN MACHINERY,

## *A Dependable Screw Wrench*

The "W. & B." Machinists' Knife Handle Wrench possesses all the strength, toughness and rigidity that can be drop-forged into a Wrench, is easily adjusted to any size nut within its range, and does not jam under strain.

With head and bar drop-forged in one piece, extra heavy jaw oil-hardened and solid screw turned from wrought steel, it is a heavy duty wrench which (like all other Williams' Superior Wrenches) can be absolutely depended upon.

**7 sizes, 6 to 21 inches, carried in stock. Two other patterns also.**

## MORROW TALKS

Our responsibility for every Morrow Twist Drill does not end until that drill has proven itself in your service.

Before it leaves the factory, every Morrow Drill has been submitted to the most rigid test known to our drill experts—indeed, the most rigid test known to any drill maker.

Why?

Because the founder's dictum that "it pays to make the best" actuates the Company throughout its career.

Your satisfaction is positively guaranteed with every drill. Order by the name "Morrow."

Try your jobber first.

SKINNER CHUCKS

TRADE MARK

# A Book of Information For Chuck Users

A book that shows the various types of chucks and their uses should be helpful to the machinery buyer and machinery salesman.

A book containing this information, together with suggestions as to the care of chucks, best methods of setting up and best way to handle certain operations, should be useful to the mechanic.

We have just published such a book

## "CHUCKS AND THEIR USES"

It contains information based on more than thirty years' experience in building chucks.

We shall be glad to send to any interested person a copy of "Chucks and Their Uses." We will also send to superintendents or factory managers a supply of these booklets for distribution among the mechanics who may be able to make use of them.

There is no obligation—no charge. Our compensation is the knowledge that we are assisting users to better understand the proper use of chucks.

*Send for your copy now. No charge*

ESTABLISHED 1887

# The Basis of File Efficiency

The basis of file efficiency is keen cutting.

When a file ceases to cut keenly, discard it and buy a new one. Otherwise you are wasting labor-time, which costs more than files.

The following brands have teeth designed to cut keenly and they are hardened so as to hold their keen cutting qualities.

They are the standard of file quality.

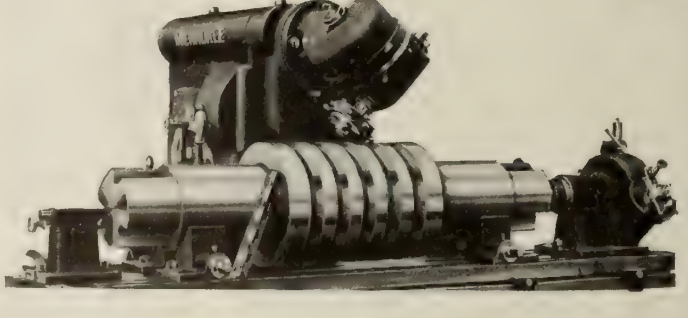
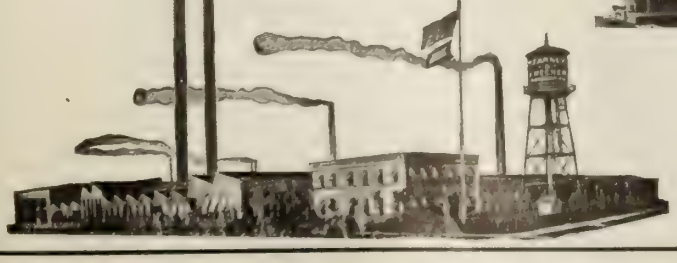
# MILWAUKEE MILLING MACHINES



## Efficient on Light and Heavy Milling



Heavy milling jobs are not unknown to Milwaukee Universal Milling Machines, while delicate and intricate ones are efficiently performed with little effort.

Both light and heavy milling operations are handled with such smoothness and accuracy that the finest results are obtained. Because Milwaukee Universal Milling Machines perform such a wide variety of work, they are particularly well adapted for the tool-room.

The jobs shown in the two illustrations are representative of "Milwaukee" adaptability. The upper illustration shows a jig being bored with a fly cutter. The lower illustrates the milling of a chilled roll with the use of a Universal Milling Attachment.

# Cab Tire Cable

Work in tunnels and boilers, on structural steel work, in railway yards and garages, and on shipboard, is seriously impeded without satisfactory portable lights.

Cab Tire Cable is the solution of the difficulty. It is so flexible you can tie it in knots and it won't even kink. Because of the absence of any outer braid over the tough rubber jacket, it will withstand the roughest abuse and exposure.

Used with the No. 301 Hand Lamp and No. 511 Plug and Receptacle illustrated, it completes a water, oil and gas proof portable, to the lasting satisfaction of its users.

# DAVIDSON

# High-efficiency generation of electric power with rope drives

For large generator installations where the slightest inefficiency in the transmission of power from the driving force to the generater is costly, Dodge Rope Drives have advantages that other methods of power transmission cannot present.

Rope drive flexibility is unequaled. The same efficiency obtains whether the sheaves almost touch or are at a distance; whether they are in line or around a corner and at an angle.

Under overloads rope drive efficiency increases rather than decreases.

A thousand horsepower rope drive is quieter than a six-inch belt.

These things alone make a choice of generator drives unwise until the Dodge Rope Drive is thoroughly investigated.

## DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

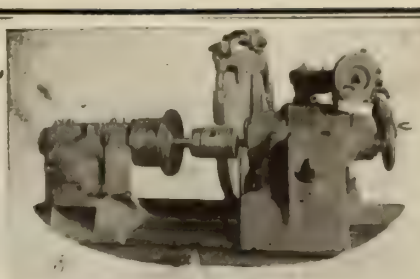
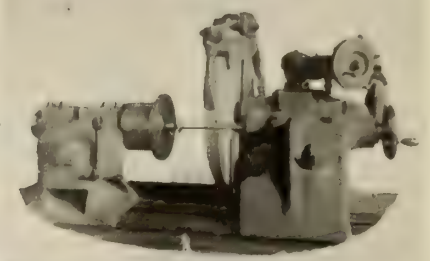
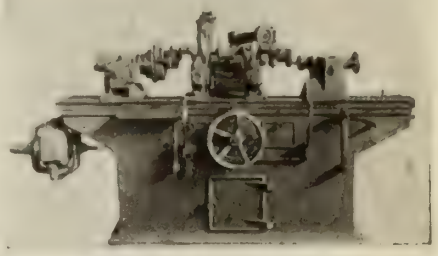
LANDIS







# No. 14A SPECIAL GRINDING MACHINE

This Landis Grinding Machine can perform all the grinding operations necessary to repair any gasoline motor as good as new.

It is designed especially for the small shop not having a large volume of similar parts. On such work it **will** show profits. We know it can be done even if you have only a small amount of repair work. Write us to-day.

# HENDEY

## This Spiral Relieving Attachment Produces Better Tools

In addition to all ordinary forms of relieving with straight flutes, you can, with this attachment, relieve taps and hobs with spiral flutes.

The advantage of spiral over straight flutes in tools of this character is obvious. It gives the tool a cutting edge which is square with the body of the tooth and properly balanced. As a result, the tool cuts better and faster.

**Bear this attachment of the Hendey in mind when considering the purchase of lathes.**

# QUALITY and QUANTITY CIRCULATION

### *The Facts are in Demand*

THE careful buyer of advertising space demands to know the exact quality and quantity of circulation of the medium he has under consideration. Mere claims won't do any more. Cold facts must be produced—facts beyond the shadow of doubt.

Advertisers who place their messages through the columns of the MacLean Technical Papers find they get both quality and quantity circulation.

Both of these facts are actually proven by the Audit Bureau of Circulations. This A.B.C. statement counts only bona-fide, paid-for circulation. It refuses to include copies printed and distributed as specimen copies or as "bulk" subscriptions, and it tells you definitely just what kind of people read these papers.

The MacLean Technical Papers are well established. permanent powers to which anyone may turn with confidence.

**Canadian Machinery**
(Weekly)

**Power House**
(Semi-Monthly)

**Canadian Foundryman**
(Monthly)

**Marine Engineering**
(Monthly)

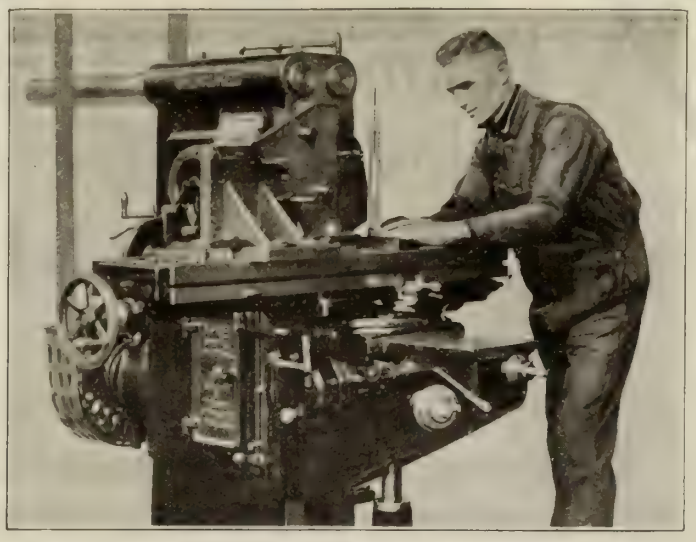
### *Pledges of Truth Required*

THROUGHOUT Canada you will find the great majority of sober, thinking Business Men, Engineers and Mechanics, conscientious readers of one or more of the MacLean Technical Papers. In building up this clientele of responsible readers the MacLean membership to the **Canadian National Newspapers and Periodicals Association** exerts an important influence.

Enrolment in this association demands the following pledges—"To consider first the interests of the Subscriber." "To work for truth and honesty in all departments, and among other things to supply advertisers with full information regarding character and extent of circulation."

Rigid adherence to the principles set forth above have resulted in the MACLEAN papers becoming the greatest disseminators of technical information and trade news in the British Empire.

THE monthly, semi-monthly and weekly publishing of the four papers listed above is a task that demands the utmost from a thoroughly capable organization. Technical men with years of practical experience present articles and editorials of a "better business" nature. Advertising men of proven ability plan campaigns and assist in the preparation of copy. Typesetters, press operators, proof readers, artists and even the messengers work with the all impelling incentive of better accomplishment.



To this spirit of splendid co-operation is credited the growth from a small beginning to what is now the largest publishing business of its kind in the British Empire.

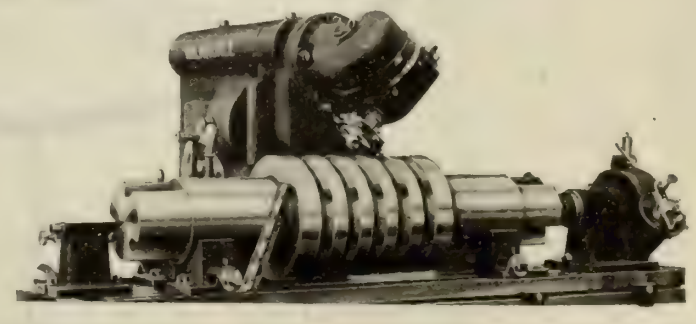
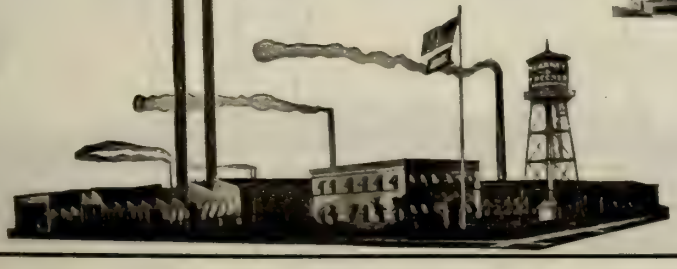
# MILWAUKEE MILLING MACHINES



## Efficient on Light and Heavy Milling



Heavy milling jobs are not unknown to Milwaukee Universal Milling Machines, while delicate and intricate ones are efficiently performed with little effort.

Both light and heavy milling operations are handled with such smoothness and accuracy that the finest results are obtained. Because Milwaukee Universal Milling Machines perform such a wide variety of work, they are particularly well adapted for the tool-room.

The jobs shown in the two illustrations are representative of "Milwaukee" adaptability. The upper illustration shows a jig being bored with a fly cutter. The lower illustrates the milling of a chilled roll with the use of a Universal Milling Attachment.

# THE JOHNSON FRICTION CLUTCH

## The Case Against the Countershaft

The old familiar countershaft drive, through cross belts and tight and loose pulleys, stands accused of the following offences against efficiency.

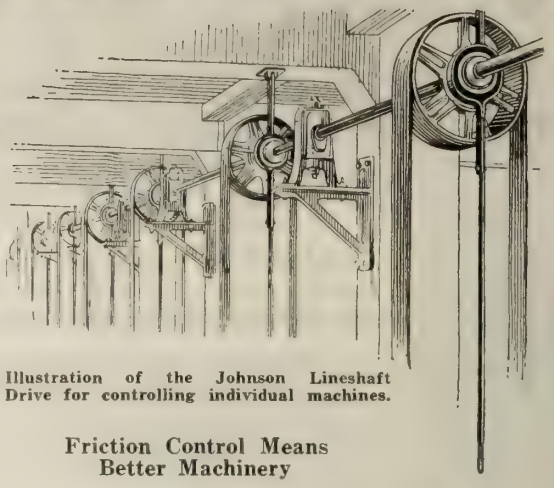
In that it—

1. Involves needless equipment.
2. Costs too much to set up.
3. Prevents economical and systematic use of space.
4. Operates sluggishly.
5. Multiplies belt troubles and the resultant cost of upkeep.

Modern practice has discarded the antiquated countershaft for the simplicity and efficiency of the clutch drive direct from lineshaft.

**Adopt the Johnston Lineshaft Drive**

The economical, efficient and durable method of power transmission through friction control.



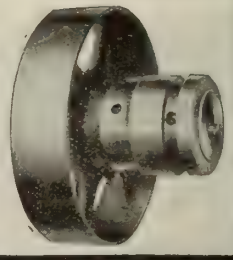


Illustration of the Johnson Lineshaft Drive for controlling individual machines.

**Friction Control Means Better Machinery**

Whether it is applied overhead or in the machine itself.

**Write for our Booklet "Clutches as Applied to Machine Building" and our Yellow Catalog.**

*For work requiring the utmost accuracy—*

# ROCKFORD MILLERS

have established an enviable reputation among prominent manufacturers for accuracy, simplicity in construction and ease of operation. That they have been able to do this is credited to the great care exercised in their design, and the high-grade workmanship used in their construction.

All feeds on the Rockford are controlled by one lever — the main spindle is instantly adjustable by a single nut, and the operator can complete a job without leaving the front of his machine. These are a few of the points that have made the Rockford a favorite with the men as well as their employers. We would like to tell you more about these machines. Write us for full information.

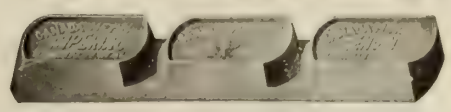
# LA SALLE

**Has an Advantage Over Other Grinders**

There is some outstanding feature of all La Salle Grinding Machines that lends it exceptional productive ability.
The American Drill Grinder is especially adaptable for grinding twist, flat and three-lipped drills, because it has automatic lip rest and caliper jaw device, which assures proper clearance on all sizes of drills automatically. Send for descriptive matter covering our entire line of grinding machinery.



American Drill Grinder
For Wet or Dry Drill Grinding 1/8" to 2¼". Also 1/8" to 3½" dia.

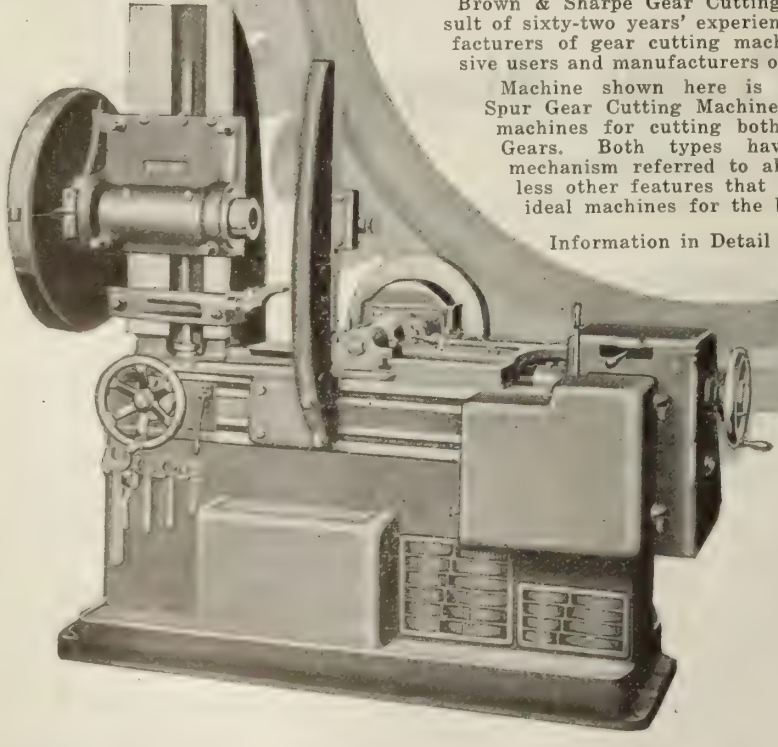
# MAKE THE RAPID AS WELL AS ACCURATE SPACING OF GEAR TEETH POSSIBLE

## BROWN & SHARPE Gear Cutting Machines

**Because of the Positive, No-Shock, Independent Action of the Indexing Mechanism**

***Accuracy is Assured by:***

The precision-cut teeth of the index wheel, which is large in proportion to the gear being cut, and the positive action of the indexing mechanism which is accelerated at the start and retarded at the end of each indexing period to eliminate shocks at any stage of the movement.



**And a High Production Rate Because**

The indexing mechanism acts independently of feed and speed of cutter, resulting in a constant, high speed in indexing, regardless of feed and speed of cutter.

Brown & Sharpe Gear Cutting Machines are the result of sixty-two years' experience, not only as manufacturers of gear cutting machinery, but as extensive users and manufacturers of precision-cut gears.

Machine shown here is from our line of Spur Gear Cutting Machines. We also make machines for cutting both Spur and Bevel Gears. Both types have the indexing mechanism referred to above and countless other features that make them the ideal machines for the busy shop.

Information in Detail on Request.

# Accurate weights instantaneously

IN machine shops and industrial plants throughout the world, Fairbanks-Morse Dial Scales are giving assured protection in eliminating beam readings. The correct weight shows instantly, in plain figures on a big dial, as soon as the load is moved on to the platform. These Scales are self-contained, all metal, strong and durable for constant service. They save money because they save time.

You can secure a Fairbanks-Morse Scale to suit your particular requirements in the weighing of all incoming or outgoing material, while being loaded, unloaded, or otherwise moved by cranes, hoists, etc.

Our nearest Sales Office will be glad to send any information you may require.

VOL. XXV. No. 17. April 28, 1921

# Various Methods of Producing Threads

## Threading Locomotive Set Screws—Steel Axles—Special Nuts—Tractor Axles—Worms—Lead Screws—Fine Pitch Threads and Internal Threads.

By J. H. MOORE

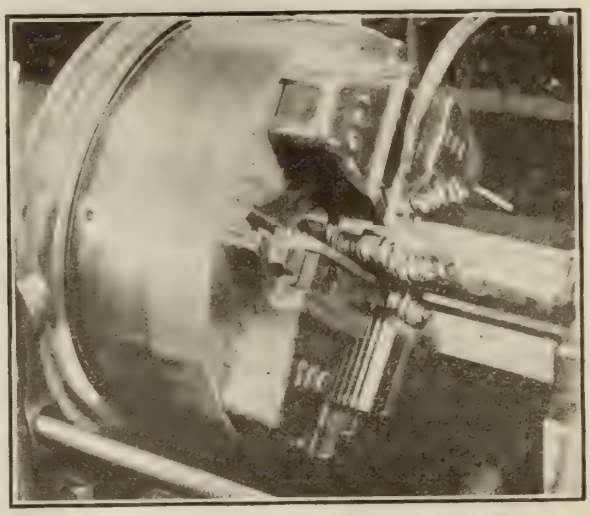

FIG. 1--SHOWING DIE-HEAD IN OPERATION.

ACCORDING to an old friend and authority, Daniel Webster, a thread is the projecting helical rib of a screw, the successive turns of which are often called teeth. This derivation is altogether too high-brow for our use, so let us simply state that a thread is something that mechanics are familiar with, have cut many a time, and hardly require a picture of to know what it looks like.

Why this peculiar introduction? you may ask. Merely to lead up to the next question, viz., How did you form the thread? Did you use a hand die? Did you use the lathe? Or did you form the thread by some other process?

The hand and lathe system requires no comment, for practically every mechanic has made threads by both these methods. But how about the manufacturing plant where duplicate threads are required in quantities? Either of the above methods is too slow, as too much care is necessary to produce approximately correct threads on the lathe. In such cases threading machines, irrespective of their type, are a necessity. Without them we could not manufacture many articles at present existing prices. Think of the bolts used on certain styles of machine tools, or even on pumps and engines. Can you see them in fancy, row upon row, circle above circle, each bolt a duplicate of the other, as far as practical need demands? Then again there is the finer screw, the thread of which must be absolutely correct. How could such threads be produced without some mechanical means to ensure a high degree of efficiency?

Believing that readers would be interested in examples of threading work performed, we have gathered together some interesting data on the subject, and will first of all start with the Landis method of producing threads. The photographs covering this method of threading were kindly supplied by the Landis Machine Co., Inc., Waynesboro, Pa., and bring out some very valuable points.

As the average mechanic knows by sight the appearance of these threading machines, we will confine ourselves to illustrations showing work performed, rather than photographs of the machines themselves. Briefly, such machines are used for obtaining production, and the standard style consists of a bed, a headstock, a die head and a carriage equipped with gripping vises. Depending on the size of work to be threaded, the machine is of proportionate strength, and in all cases they are provided with a die lubricating system. This brings us to the die itself, which is of course the main part of the machine. The die head used on the machines we are speaking of is of all steel construction, and the die proper consists of four chasers tangentially inclined to the work, to agree with the pitch of thread to be cut. Of course, adjusting mechanism is provided, this being of special design. Within the head of the die is an automatic opening and closing device which derives its action from the forward and backward travels of the carriage. The same device locks the head. Graduations are marked both right and left hand for all sizes within the range of the head. Briefly, this gives the general principles of the die head, but it by no means covers the details. Readers desiring further detail can get in touch with the company manufacturing these machines, but for the purpose of this article sufficient has been given.

These machines are, of course, made in different sizes and styles, ranging from the simple single head bolt threading type to the triple headed type. Depending upon the work to be accomplished, machines are used with or without a lead screw attachment. Then again for stay bolts, the machines are modified in design to suit this style of work, but in the main, the principle involved is the same.

Then again, there are the pipe and nipple threading machines. These vary in size and design, but all are based on the same principle, viz., that of a rotary die

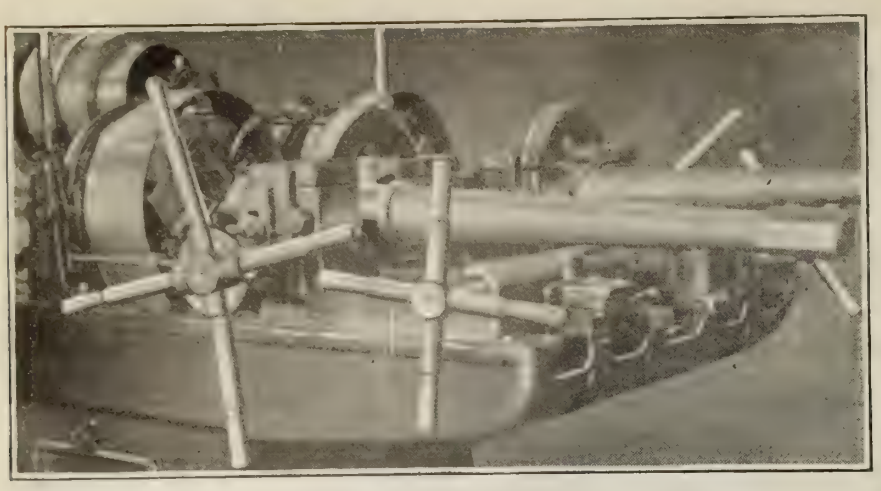

FIG. 4—THREADING CHROME NICKLE STEEL AXLES.

head. Boiling the whole matter down to a few words, the art of threading by this method consists of feeding the work into a suitable revolving die contained in a die head. Once the work has entered the die the true pitch of thread and proper diameter are assured, the die being set to proper size before commencing. Without going into further details, let us consider some examples of work performed.

### Actual Threading Work

Fig. 1 gives a good view of a die head in operation. Of course, the main idea in showing this view is to illustrate how large a chip can actually be produced, even when cutting at a rate of 30 circumferential feet per minute, as the die was, when the photograph was taken. The stock was 30 point carbon steel, this being a rather nasty material to cut. It will be noted that the chips are similar to that of a lathe tool. This is due to the fact that the die itself operates on the same principle as a lathe tool.

Fig. 2 depicts a 4 inch single head motor driven machine threading locomotive set screws, the production by this method being 700 screws every ten-hour day.

Fig. 3 illustrates a 2-inch triple head machine. This is also used in a railroad shop, and the machine shown has been in use for twelve years. The triple head type of machine is much favored in railroad shops, due to the fact that each head may be set to suit a different size bolt, this of course reducing to a minimum the time of changing from one size to another.

The next photograph, Fig. 4, shows a 1½-inch double head machine threading axles. These axles are made from chrome nickel steel, heat treated, and the last operation is that of threading. It is, therefore, very important that the thread be correct, otherwise the axle would be scrap, and all previous work would be wasted. The reason we emphasize this point is to illustrate the fact that threads turned out by machine are perfect for all practical purposes. In fact, with proper care they cannot help but be correct, the dies guarantee that. This is a big feature, for once the dies are set, a cheaper class of labor can be used than otherwise could.

Although we have refrained from showing photographs of machines only, we make an exception in the case of Fig. 5. This depicts a 4-inch single head leadscrew threading machine with extension bed for cutting threads on stay tubes and stay rods for marine boilers. The pitch of the threaded stay tubes and stay rods must be continuous, and the machine was designed for that operation. The threads are first cut on one end of all stay tubes and stay rods. The threaded end is then gripped in the carriage at the end of the extension bed. The die head, the leadscrew, and the grips are then timed, and the other end of the rods and tubes threaded. In this way a continuity of thread is obtained.

We could go on indefinitely showing illustrations of applications of this threading method. We have photographs before us depicting the threading of work in automotive plants, the machines being equipped with special arbors for holding certain portions of the work. Other photographs depict machines for threading and cutting off pipe, machines for threading axle housings, leadscrews, stay bolts, etc. In fact, any work that can be accommodated within the limits of such machines can be threaded by this method, and where the quantity required warrants it, a machine specially suited for the work can be designed.

### The Thread Milling Method

Although the previous method described is known in some small measure

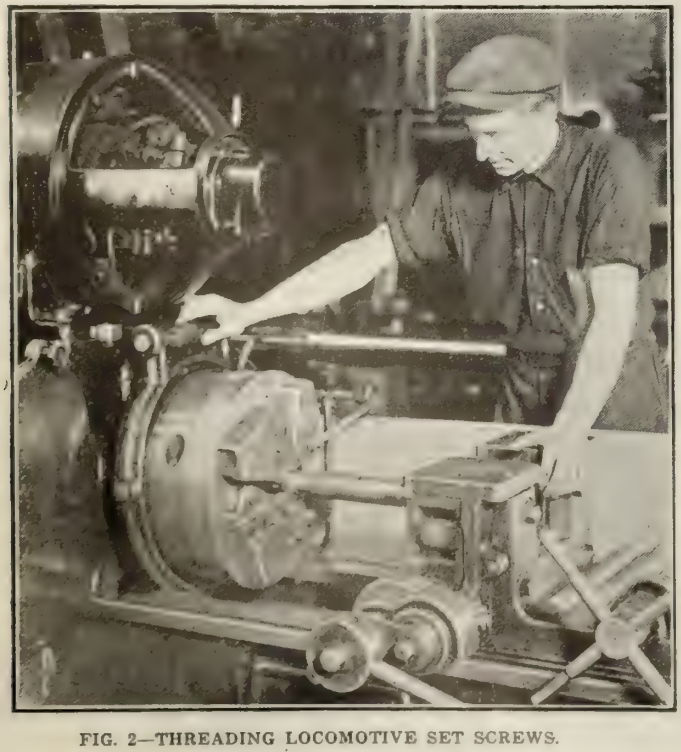

FIG. 2—THREADING LOCOMOTIVE SET SCREWS.

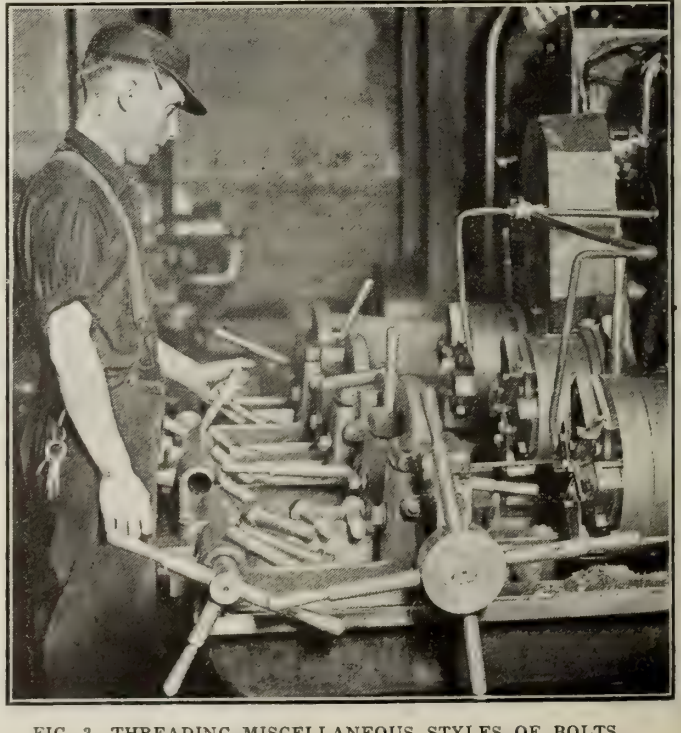

FIG. 3—THREADING MISCELLANEOUS STYLES OF BOLTS.

to the average mechanic, the system of thread milling remains somewhat of a mystery to him, not because it is difficult to understand, but because he does not take the trouble to investigate. Through the courtesy of the Smalley General Co., Inc., Bay City, Mich., and the Lees-Bradner Co., Cleveland, Ohio, we are able to discuss and show various examples of thread milling. First of all, what is thread milling?

Although not generally known, the art of thread milling is not a new process. As far back as the civil war, machines of this type were in use, but they are said to have been very crude and light. It is only within recent years that they have been developed into a commercial success. For the benefit of readers who are not familiar with the appearance of a thread miller let us refer to Fig. 6. This is what is known as a No. 23 S-G thread miller, and is primarily a singe purpose machine

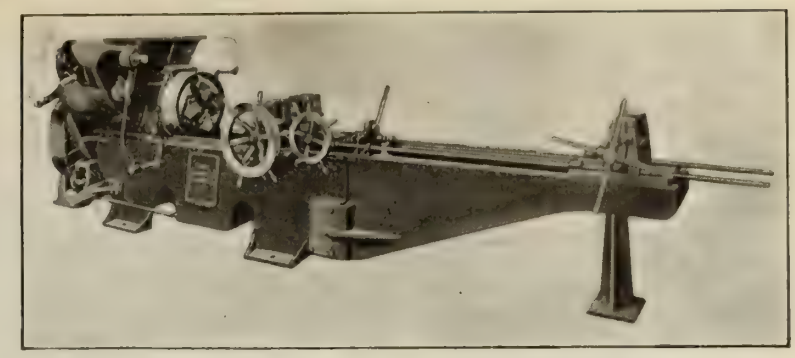

FIG. 5—4-INCH SINGLE HEAD LEAD SCREW THREADING MACHINE.

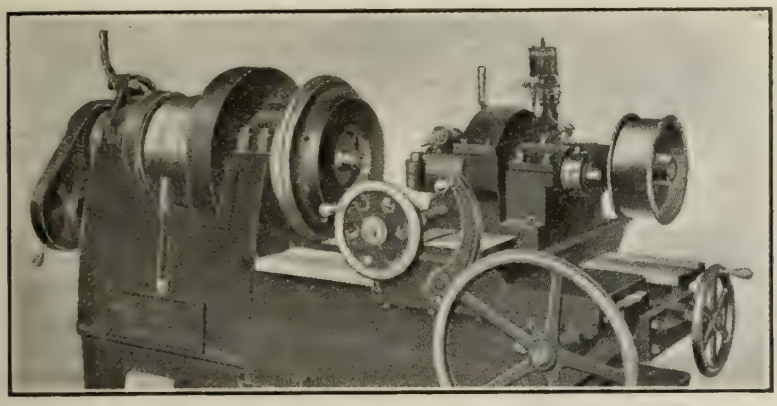

FIG. 6—A TYPICAL S-G THREAD MILLER.

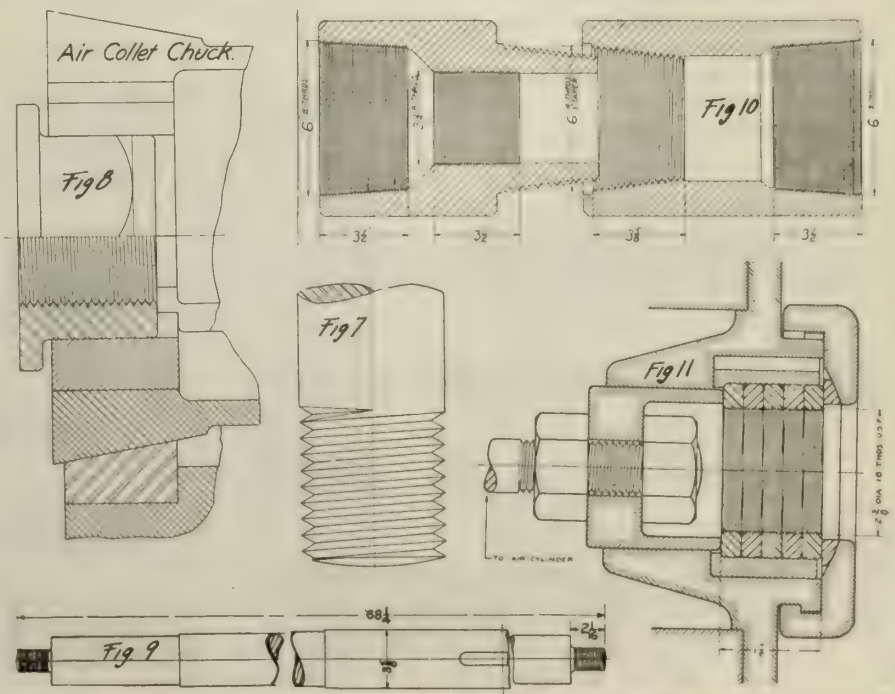
designed for production work. This particular machine has three milling speeds, also three turning speeds which are proportional to the milling speeds. In some cases the three turning speeds are not embodied, but this is simply a question of design, rather than a change of principle. All S-G thread millers are based on the same principle, different types being suited for various classes of work.

Briefly, here is the action of these machines. Located on the ways is the bottom slide which, in turn, carries the top or cross slide. This cross slide is controlled in relation to the bottom slide by means of a micrometer screw by which the diameter of the thread is determined. The top slide carries the milling spindle. The milling hob is held on this spindle by means of a tapered arbor and draw in bolt.



During the milling operation, while the work held in the chuck makes one revolution, the milling head is moved on the ways by the leadscrew a distance amounting to the pitch of the thread to be milled. Either internal or external, right or left hand, straight or tapered threads can be milled, although it is not possible to mill an absolutely square thread. A very slight angle is necessary for clearance, but acme threads are easily milled. When internal threads are to be milled the diameter of the hob must be slightly less than the diameter of the part to be milled in order to allow ingress and egress of the hob. This, of course, does not infer that a large hob must be used for large work. While usually a hob of large diameter would be used for milling an internal thread of large diameter, there is no particular relation between the diameter of the thread and the hob used.

In the single purpose S-G machine, milling of thread only is performed, but in the general purpose type, both turning and milling are accomplished. This, of course, enables the surfaces to be turned true with the thread, and in many cases saves an extra operation on some other machine. Of course, a lower speed is used for milling than that used when turning, but neither the tool nor the hob need to be removed during operations. In milling threads of 12 per inch or more, a direct driven spindle is used, but for coarser threads a back geared spindle is employed.

### Milling Speeds

Milling speeds depend upon several factors, the material to be milled, the rigidity of machine, quality of hob, and the finish required. In sheet and cast iron, hob manufacturers recommend a cutting speed of 80 feet per minute and .004 inch feed per revolution with a hob 2⅛ inches diameter, which gives a milling feed of approximately 6 inches per minute. As a rule, however, a well constructed machine will run about a 9 inch feed instead of 6 inch.

It should be remembered that in thread milling the roughing and finishing cut are taken at the same operation. It therefore follows that the slower the

FIGS. 7 TO 11—SHOWING EXAMPLES OF WORK PERFORMED.

milling feed the better the finish. When a polished finish is required it is good policy to slow up the machine to 5 or 6 inches per minute, or else take a roughing cut first, following this with a light finishing cut. This procedure, however, is very seldom necessary. With milling speeds running from 9 inches to 12 inches per minute, the limits can be held to .001 inch or .002 inch, depending upon circumstances. In annealed high speed or hard alloyed steels the usual milling speed is from 2 to 3 inches per minute, with a cutting speed of 35 to 45 feet.

A great diversity of opinion exists as to the saving in time, increase in production, etc., between the various methods of threading. It is not for us to take sides. We merely present the methods used, the time taken to produce certain work, and any other data that will interest readers. From this point on, it is up to the reader himself to decide which method appeals to him. For example, the thread milling fraternity frankly state that in some cases they have shown increased production over other methods, while in others they have not. Of course, they finish these remarks by emphasizing that the thread obtained by their process is superior in quality. On the other hand, the champions of the Landis, and other systems, will tell you that they can give you better production, better threads, etc., than the thread milling, and so on. In other words, it is a case of experience; take your choice; but let it be thoroughly understood that we are simply presenting for readers' benefit the examples shown, not with any idea of comparison in mind. It might be well to add, before going on with examples of work performed, that thread millers, especially of the flange type, are often provided with special attachments. For example, facing attachments, etc. These, of course, are placed on the machine to eliminate any further operations. As far as possible the machine is designed and arranged to complete the work at the one set up.

### Some Examples of Work

Let us now consider some examples of work performed on S-G machines, these being taken at random. Fig. 7 depicts a very common job, the material being No. 3 government steel 1½ inches diameter, 6 pitch thread, 1½ inches length of thread. On a ten-hour run an average rate of 1½ minutes for the operation was attained. This included facing and chamfering the end. Every thread was a forced fit, and had to pass government inspection. An air collet chuck was used.

The next example, Fig. 8, shows a special nut. The thread is 1⅝ inches diameter, 1½ inches length, and .12 inch pitch U.S. standard. The milling feed used was 9.6 inches per minute, and the material was .20 carbon steel. An air operated collet chuck was used, and this work was accomplished in a No. 2 machine. Here is a brief statement of the time for completing this nut. Chucking 5 seconds, boring and facing 1 minute 45 seconds, adjusting head for milling 10 seconds, milling 32 seconds, removing from chuck 5 seconds, this bringing the total up to 2 minutes 37 seconds.

Fig. 9 illustrates a tractor axle threaded by this method. The thread is 1½ inches diameter, 2 1-16 inches long on each end, 6 pitch U.S. standard. The material is machinery steel, and the milling feed used is 4.35 inches per minute.

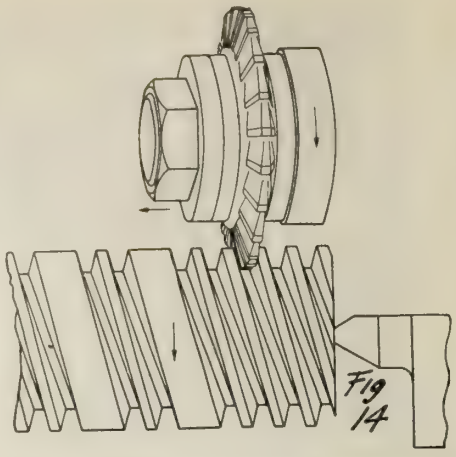


FIG. 14—CUTTING A TRIPLE THREAD LEAD SCREW.

Each thread is milled in 65 seconds, with a floor to floor time of 5 minutes 37 seconds, the balance of time being of course used up in handling. These parts were chucked through the rear end of spindle. It was a rather awkward operation as the pieces were larger in the center, and the type of chuck used would not let them through. A collet chuck with false collets would have permitted faster chucking.

The work shown at Fig. 10 is very interesting. The piece milled is a pin and box, and the thread is 3¾ inches diameter, 4 inches length, 6 pitch U.S. standard, with 3 inches taper per foot. The milling speed used is 4½ inches per minute, and the material .20 carbon steel. A hand operated screw chuck is used, and floor to floor time is six minutes. The former time of this piece, as threaded in the lathe, was 1½ hours.

Fig. 11 illustrates a good example of multiple chucking. To insure the best results from this style of chucking the parts should run close to size. The work shown was accomplished on a No. 23 machine, and the 6 inch hollow spindle on this size machine afforded a good opportunity of doing this class of work in a face plate chuck, thereby holding the parts to be milled within close relation to the main bearing.

The chuck used was air operated, and here is the time occupied: Chucking in and out 15 seconds, setting carriage and hob 5 seconds, milling 50 seconds. This makes a total of 1 minute 10 seconds or a time of 14 seconds each, there being 5 nuts chucked at one time. The thread was 2⅜ inches diameter, 1⅞ inches long, and 16 pitch. The material was machine steel, and a milling feed of 9 inches per minute was used.

Let us next pass on to another type of thread miller, namely the Lees-Bradner. From now on, the information given will be from their point of view.

### Thread Milling Work Classified

The views to follow are intended to clarify the subject of thread milling by separating the work into classes, explain-

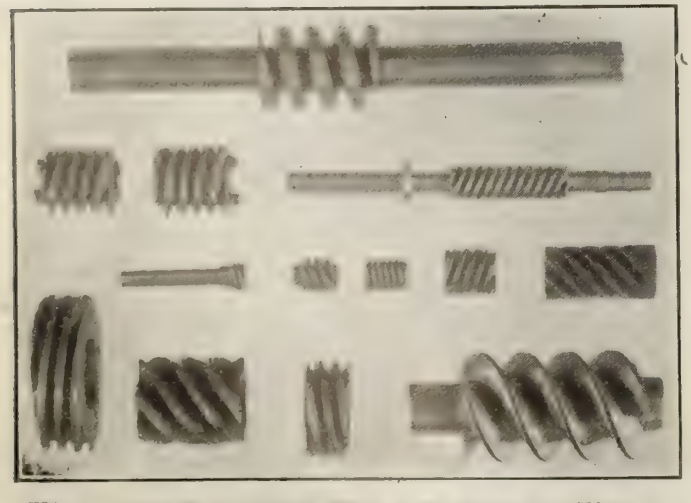

FIG. 12—VARIETY OF WORMS THAT HAVE BEEN PRODUCED BY THREAD MILLING.

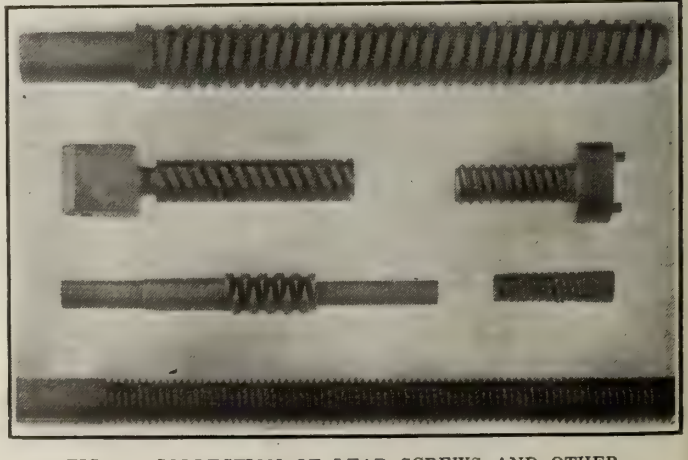

FIG. 13—COLLECTION OF LEAD SCREWS AND OTHER THREADS CUT BY THREAD-MILLING PROCESS.

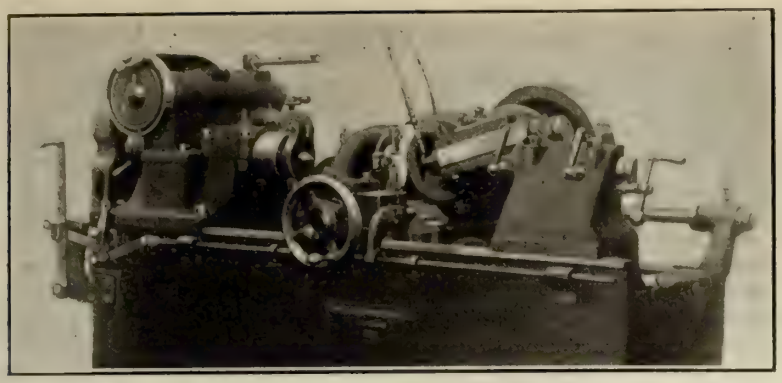

FIG. 15—A STANDARD L-B THREAD MILLER.

ing the method employed for each class of work.

Fig. 12 shows a variety of worms both single and multiple threaded which have been advantageously produced by the thread milling process. It will readily be seen that a worm with a large number of threads has a greater thread angle and approaches a helical gear in appearance. There may be times when the question arises as to whether a particular job should be called a worm or a helical gear. The differences are that in a worm we speak of the number of threads and of the "thread angle," meaning the angle between a thread and a line at right angles to the axis; whereas in helical gears we speak of the number of teeth and of the "helix angle," meaning the angle between a tooth and the axis of the gear.

A five threaded worm with 20 degrees thread angle might be called a five tooth helical gear with 70 degrees helix angle, except for the difference between the form of thread on a worm and the form of tooth on a helical gear. The threads on worms are usually cut with straight sided cutters and the pressure angles specified in a plane along the axis of the worm, whereas the teeth of helical gears are generated with hobs and their pressure angles are specified in a plane normal (at right angles) to the tooth. In addition to these differences it is customary to specify a helical gear by the normal diametrical pitch, whereas worms are specified by the circular pitch of the worm gears with which they are to mesh; the circular pitch of the worm gears being the same as the axial pitch of the worms. All of the jobs shown in Fig. 12 are specified as worms and use single cutters with straight sides at the required angles. Fig. 13 shows a collection of lead screws and other threads cut by the same process. We find this process illustrated in Fig. 14, which represents a triple thread worm or lead screw. The directions of rotation and travel are indicated by three arrows.

The problem of gearing up a thread miller to mill a thread of a given lead is practically the same as gearing up a lathe to cut the same lead. The carriage carrying the cutter moves along the bed of the machine parallel to the axis of the work a distance equal to the lead of the thread for each rotation of the work. The line drawing in Fig. 14 shows two threads finished and the third thread in process of cutting. Three passes of the cutter are required to finish the job except in the event of two cuts being taken through each thread on a worm of heavy pitch. If it is desired to take two cuts on a lead screw, the finishing is done at a separate setting to allow some time for seasoning between the two cuts.

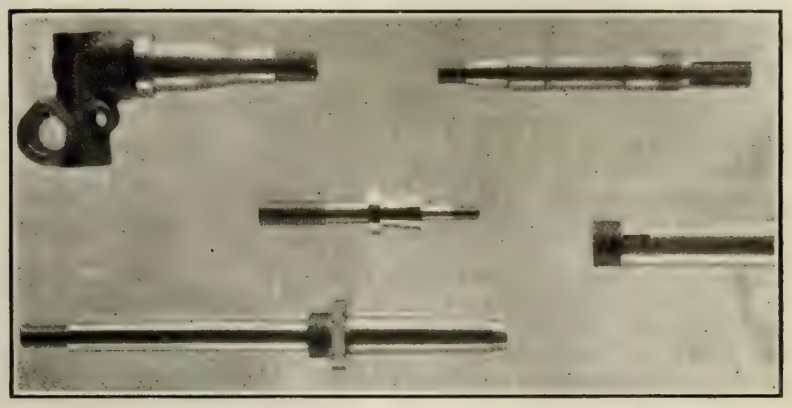

FIG. 17—A FEW EXAMPLES OF MALE THREADS THAT ARE MILLED ON PARTS HELD BETWEEN CENTRES.

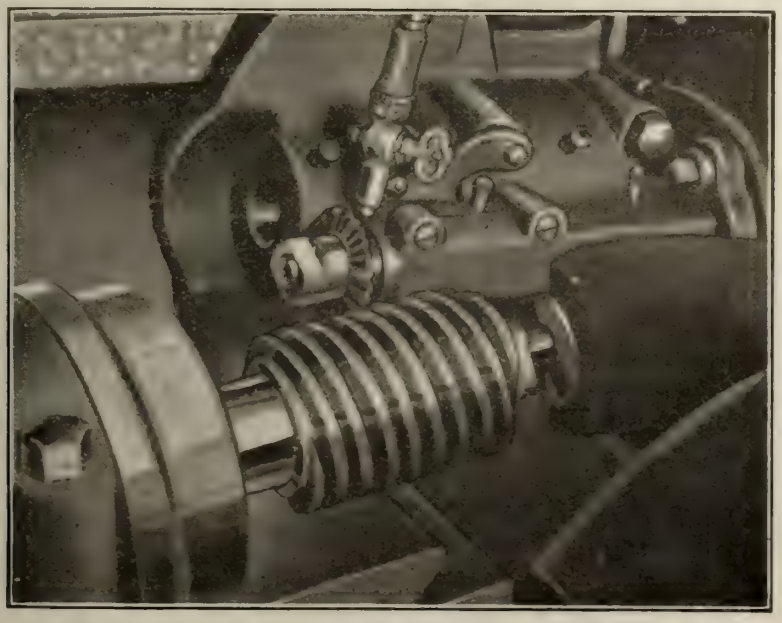

FIG. 16—THIS TYPE MACHINE IS DESIGNED PRIMARILY FOR HOBBING SPUR GEARS, SPLINE SHAFTS, ETC.

Aside from gearing up to travel the cutter one lead for each rotation of the work, it is only necessary to swivel the cutter spindle to the thread angle and arrange the work to rotate at a suitable peripheral speed for the milling feed. The question of cutter speed is merely one of material, though it should be borne in mind that a high cutter speed produces a smoother thread than a low cutter speed with any given speed of work rotation. The ratio between cutter rotation and work rotation is not fixed as it is in hobbing a helical gear.

The standard L-B thread miller shown in Fig. 15 is used for these classes of work as well as for some others which we will show later. It will be noted that the cutter spindle is arranged to swivel to the required thread angles and that the depth of the cut is controlled by a hand wheel at the front of the carriage. This hand wheel is provided with micrometer graduations and an automatic stop which insures accurate duplication of work. When multiple threads are cut with a single cutter the indexing of the work is accomplished by the indexing mechanism above the head stock. The

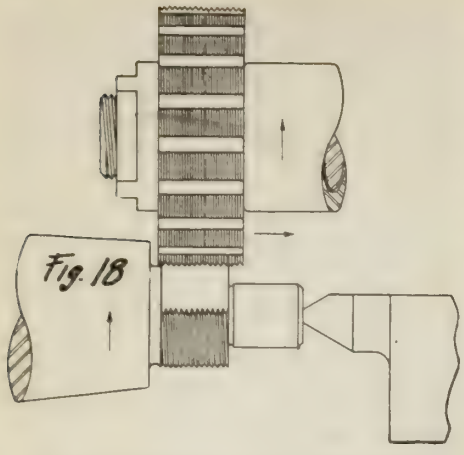

FIG. 18—METHOD OF CUTTING SUCH THREADS AS SHOWN AT FIG. 17.

machine handles work between centers or in a collet chuck.

Another machine which is sometimes used for thread milling worms is shown in Fig. 16. This is an L-B gear generator, designed primarily for hobbing spur gears, spline shafts, helical gears, worm wheels, etc. A high speed head which is special equipment provides a cutter spindle suitable for thread milling and the wide range of gear ratios available through the change gear train makes it a practical machine for the milling of worms. In many shops it is desired to produce a worm and a worm gear but the quantity does not warrant the installation of both a hobbing machine and a thread miller. In such cases the thread milling feature of the gear generator is found useful.

### Ring Type Thread Milling on Shafts

Fine pitch threads, that is, threads with a pitch of less than ¼ inch (four or more threads per inch) are milled with ring type cutters. Fig. 17 depicts a few male threads of this description on parts that are held between centers, while Fig. 18 illustrates the method of milling these threads.

It will be noted that the cutter is a gang of cutters made in one piece. It is termed a "ring type" cutter because the teeth are arranged in rings, not in the form of a thread. These ring type cutters are frequently called hobs, but since they have no lead they are not strictly hobs.

As shown in Fig. 18, the entire length of thread is milled at one rotation of the work. In ring type thread milling the axis of the cutter is set parallel with the axis of the work. The method of operation is the same as milling with a single cutter, but it is only necessary to rotate the work a trifle more than one turn instead of one turn for each thread. The cutter head is geared to travel one lead of the thread for one rotation of the work. Starting with the cutter in motion the operator engages the feed which starts the work to rotating and the cutter head to traveling; he next brings the cutter in to full depth; after the work has made one complete rotation he backs the cutter out and removes the finished work from the machine.

A comparison of Fig. 18 and Fig. 19 will make this operation clear. The operation shown in Fig. 19 is milling the smaller one of the two threads on an automobile transmission spline shaft. The larger thread is milled in the same manner on the same machine at a different setting. Should these two threads be of the same pitch the only adjustment necessary in going from one job to the other is to change the setting of the depth stop on the micrometer hand wheel. In going to a thread of much larger diameter a change would also be made in the speed of work rotation, for the peripheral speed of the work is the milling feed. In changing from one pitch to another it is necessary to change the cutter and to change the gears driving the lead screw which travels the cutter head along the bed of the machine.

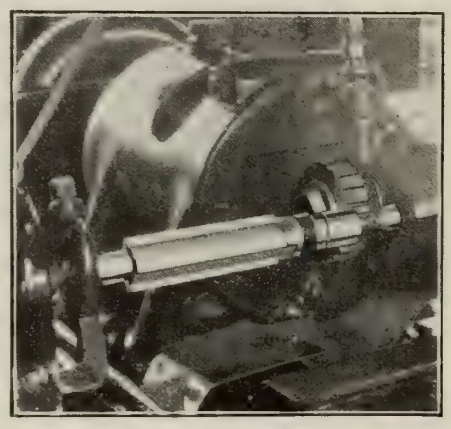

FIG. 19—MILLING A THREAD ON AUTOMOBILE TRANSMISSION SPLINE SHAFT.

The cutters employed are known as "ring type" cutters because their teeth are arranged in angular form, that is, in straight rings instead of in the form of a thread. The cutter shown in Fig. 8 is made in staggered form by the omission of each alternate tooth in each ring, but the common practice at present is to leave all of the teeth in. The distance between teeth measured parallel with the axis of the cutter is the same as the axial pitch of the thread to be cut. No correction is necessary for the difference between axial and normal pitch, for the axis of the cutter is set parallel with the axis of the work. There is a very slight difference between the pressure angle of the teeth in the cutter and the pressure angle of the resulting thread, but since this method is used on threads of relatively fine pitch and consequently of small thread angle, this difference is negligible.

The threads produced in this manner are extremely accurate and uniform results are easily obtained on quantity production. Thread millers of this type have been used in the manufacture of plug and ring thread gauges. These gauges were found to fit so closely that air holes had to be drilled to allow the mating gauges to be screwed together.

### Milling Multiple Threads With Ring Type Cutters

Fig. 20 shows an interesting application of ring type cutters to the milling of threads longer than the cutters. The cast iron drum shown is 9 inches in diameter and 40 inches long, threaded its entire length ⅛ inch pitch 1 inch lead. A ring type cutter with square teeth measuring ⅛ inch from center to center is employed on this job and the machine is geared up so that the cutter travels 1 inch for each rotation of the work instead of ⅛ inch which would be the case in cutting a single thread. At each revolution of the work the cutter travels 1 inch along the axis of the work so that the complete thread is finished in 41 revolutions of the drum. This method of threading may be compared with the cutting of a double thread worm or screw by the method shown in Fig. 3 but using a double cutter instead of a single cutter. If, for instance, we use a triple cutter on the job shown in Fig. 14 it would be possible to finish the complete thread at one cut, rotating the work as many times as the lead of the thread goes into the length of the thread. This, however, would necessitate the making of a specially formed cutter, which would really be three cutters in one. The central cutter would be the same as the one used in milling one thread at a time and the cutter would be so located on the cutter spindle that the center of the cutter comes at the point about which the cutter

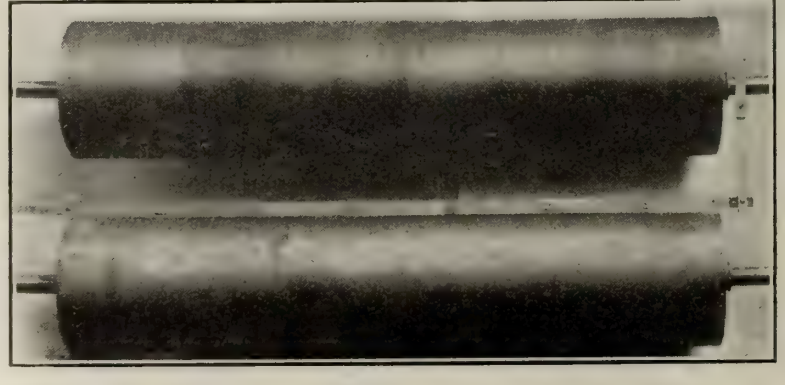

FIG. 20—THIS DRUM IS 9″ DIAMETER, 40″ LONG, AND THE THREAD IS ⅛″ PITCH, 1″ LEAD.

spindle swivels. The two outer cutters of this triple cutter would necessarily be of slightly greater outside diameter and the tooth forms would be such that all three threads would be cut the same shape. Single cutters are employed in milling multiple threads where the greatest possible accuracy is required and multiple cutters are used where production is of first importance.

### External Ring Type Jobs on Work Held in Chucks

All the parts shown in Fig. 21 are threaded externally with ring type cutters. These parts must be held in chucks or special fixtures of some sort which may be either hand or air operated. In some cases, as for instance the externally threaded ring nut shown in the lower right-hand corner, it is possible to thread more than one part at a time. This particular part is 6⅜ inches outside diameter and has a face of ¾ inch. Three of these parts are held in a special air operated chuck and the three parts are threaded at one rotation of the work spindle. This particular job is running on a standard L-B thread miller as shown in Figs. 15 and 19. The floor to floor time on the three parts is 4½ minutes, giving a production of 40 pieces per hour.

Any of the parts shown in Fig. 21 might be handled on either standard L-B thread millers or the collet type L-B miller. The choice between these two types would depend largely upon what other thread milling work it might be desired to handle on the same machine. The standard machine, for instance, handles work held between centers and is arranged to swivel the cutter spindle for use in milling worms and lead screws as shown in Figs. 12 and 13, while the collet type machine is, on the other hand, suited for milling internal threads on work held in chucks, but is not designed to handle work between centers or to tilt the cutter spindle for milling worms and lead screws.

### Internal Ring Type Jobs

Fig. 22 shows a variety of jobs that are best handled by the ring type method on the L-B collet type miller. These machines are built in a variety of sizes with various diameters of collet chucks and of holes through the work spindle. On this

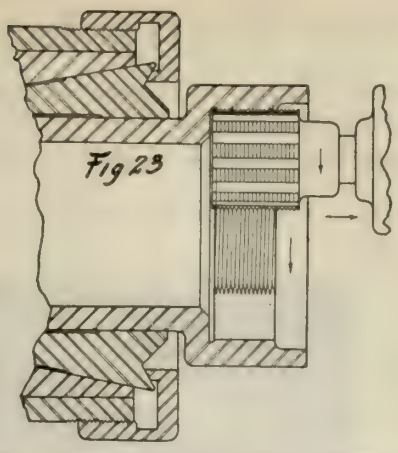

FIG. 23—METHOD OF MILLING AN INTERNAL THREAD.

type of machine the cutter spindle is fixed parallel with the work spindle and is adjustable only as to center distance between the two spindles and longitudinal position of the cutter.

The operation of milling an internal thread as shown in Fig. 23 is practically the same as the milling of an external thread as shown in Fig. 18. It will be noted that in milling internal threads it is necessary to back the cutter out of the thread and then withdraw it entirely from the work in order to remove the finished piece from the machine and place another piece in the chuck. This introduces the question of taking up back lash in the lead screw when the cutter is brought back to position to start a new thread. This is taken care of in an interesting manner. The lead screw which travels the cutter during the operation is carried on the carriage, while the movement of the carriage on the bed is controlled by the turn-stile at the front of the machine. It is only necessary that the cutter moves longitudinally a distance equal to the lead of the thread for each piece threaded. The cutter is then withdrawn from the thread by means of the micrometer hand wheel and the carriage is released so that it is free to travel along the bed of machine. The operator then withdraws the cutter entirely from the work by means of the turn-stile without disturbing the lead screw. When the new piece has been placed in the chuck the cutter is brought back to position, the carriage clamped again to the bed of the machine and the feed started at the point where it left off; thus there is no back lash in the lead screw or its driving mechanism to be taken up. The lead screw operates constantly in one direction and it is only after the entire length of the lead screw has been used up that it is reversed and the back lash taken out before the next piece is started.

Ring type cutters are designated as right or left hand according to their direction of rotation. This has nothing to do with the cutting of right or left hand threads except as it may be necessary to rotate the cutter in a certain direction in order to have the cutter feed away from a shoulder instead of toward it. In Fig. 23, for instance, the cutter is designated as "left hand" because it rotates to the left as viewed from the driven end. This designation is the same as employed for drills or reamers. This left hand cutter is, however, being used to mill a right hand thread. If a right hand cutter were used to mill a right hand internal thread it would be necessary to travel the cutter toward the work spindle instead of away from it. This would necessitate stopping the machine at the instant the thread was completed to avoid collision between the cutter and the shoulder at the bottom of the thread. With the cutter travelling away from the work as shown there is no possibility of accident if the feed stop is not set exactly, or the operator neglects his machine. No damage is done to the threads if the machine is allowed to run after the thread is finished.

### SEEK PROTECTION

Washington. — Legislation is being sought by American makers of Diesel engines to protect them against importations of this type of engine produced by foreign manufacturers at less than they can be made in the United States. The claim is made that unless sufficient protection is given either to greatly restrict or to entirely prevent importations, enough Diesel engines will be brought into this country in the next six months to equip all American ships that may be built in the next two years.

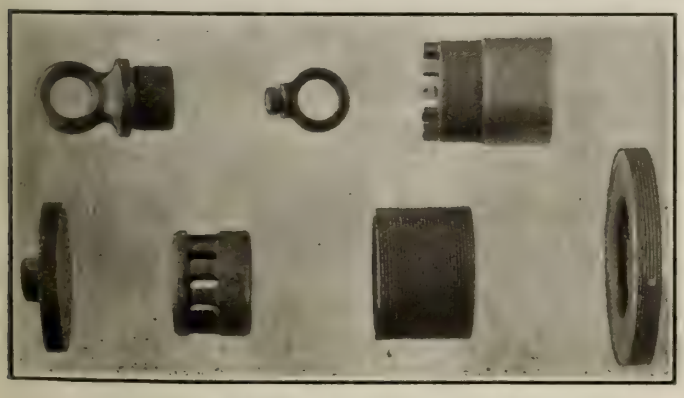

FIG. 21—EXAMPLES OF EXTERNALLY THREADED PARTS CUT WITH RING TYPE CUTTERS.

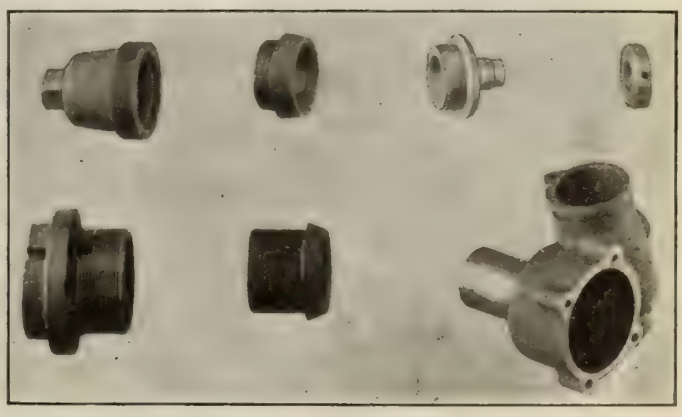

FIG. 22—SOME EXAMPLES OF INTERNAL RING TYPE JOBS.

# Machining Cast Iron Pump Body in 22 Minutes

## Pump is of Semi-rotary Type—Extreme Accuracy Necessary—Special Chuck Jaws Used—Taper Bore is Produced by Profile Method—Machining a Distributor Case for Gnome Aero Engine

By A. H. LLOYD, B.Sc., M.B.E.

CONTINUING our talk on Herbert turret lathe practice, from recent articles appearing in February 17th and March 24th issues of Canadian Machinery, we shall consider the tools used in machining a cast iron pump body. Fig. 1 depicts these tools. This pump has to be machined to a very fine degree of accuracy, otherwise it would not perform its work efficiently.

The large bore is tapered approximately 1½ deg. a side, and must be accurate in diameter and taper. The bottom face must be smooth and flat, and an exact depth from the front flange. There is also a small blind hole which serves as an end bearing for the rotor spindle. The sequence of operations is shown on the lay-out drawing at Fig. 2. The chucking is effected by means of a set of special jaws gripping through the solid metal at the bottom of the hole, and so minimising the risk of distortion. No. 1 is a centering tool for starting the drill. No. 2 is a twist drill. No. 3 combines two tools for rough facing the flange and the bottom of the large bore simultaneously. No. 4 is a standard turning head taken from a combination tool, which provides a very stiff and effective tool for rough boring the large hole parallel. No. 5 is a four-flute reamer which finish bores the small hole and squares the bottom. No. 6 is a pair of facing tools similar to 3 for finish facing—in addition to the production advantage of machining the two faces simultaneously, you have the advantage that the exact depth of the hole is assured after the cutters have been correctly set. No. 7 shows the method of producing the taper bore, which is done by a profiling method. The boring tool is mounted on a slide which can move transversely to the axis of the lathe. This is brought into position at the bottom of the large bore, and then fed into the work by a bracket on the back of the cross slide, which carries the taper former. The tool being fed into depth, the turret traverse is engaged in the reverse direction, and the profiling slide feeds away from the chuck. A spring in the slide and the pressure of the cut keep the roller on the slide against the former, the cutting tool therefore produces a tapered bore, the taper of which is governed by the inclination of the former. The former is arranged to swivel through a small amount to facilitate setting it up accurately. The machining time for this pump body is 22 minutes.

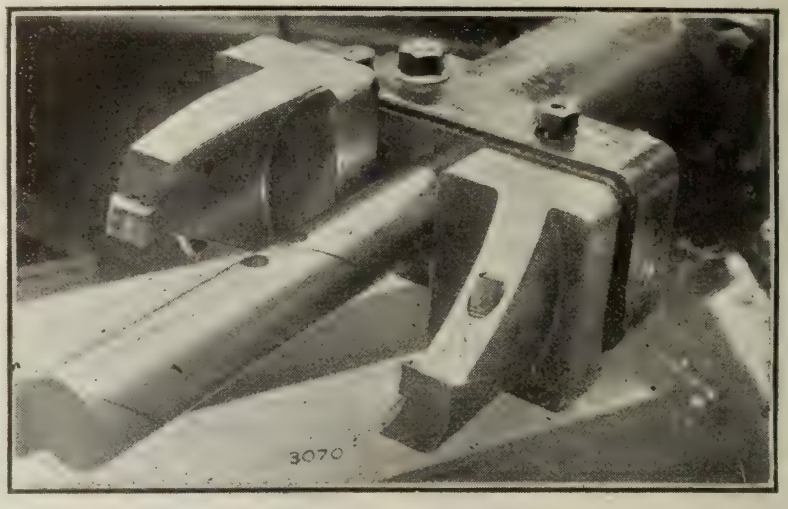

FIG. 5—CLOSE UP VIEW OF TREPANNING TOOL.

It has been said with regard to turret lathe work that the more difficult and involved it is, the greater is the economy which can be effected by the adoption of highly specialized tool lay-outs. The truth of this statement is very well demonstrated in the machining of the distributor case for the Gnome Monosoupape Aero-Engine, which is probably one of the most difficult, yet successful jobs which has been handled on a turret lathe. An idea of the shape of the piece will be seen at Fig. 3, which shows the set up for the first operation.

The finished diameter of the flange is about 14½ inches, and the overall length about 4½ inches. There is a counterbore 7 inches diameter, and an annular recess 10 inch bore, 1 7-16 inches wide, 4 inches deep, which necessitates a trepanning operation. In work of this

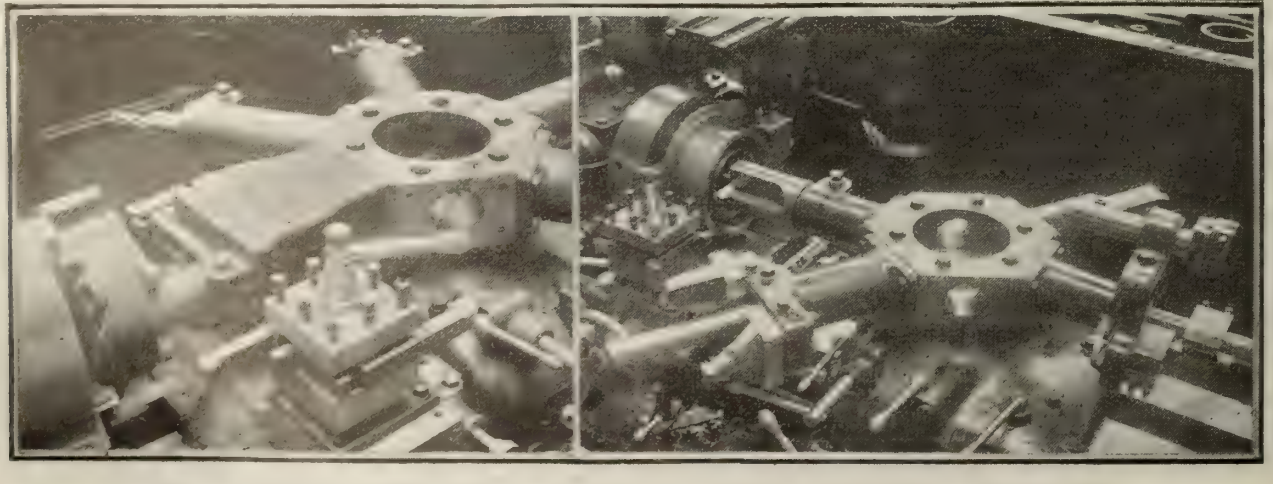

FIG. 1—LEFT HAND VIEW SHOWING SET-UP FOR MACHINING SEMI-ROTARY PUMP BODIES.
FIG. 3—RIGHT HAND VIEW. SET-UP FOR FIRST OPERATION ON DISTRIBUTION CASES.

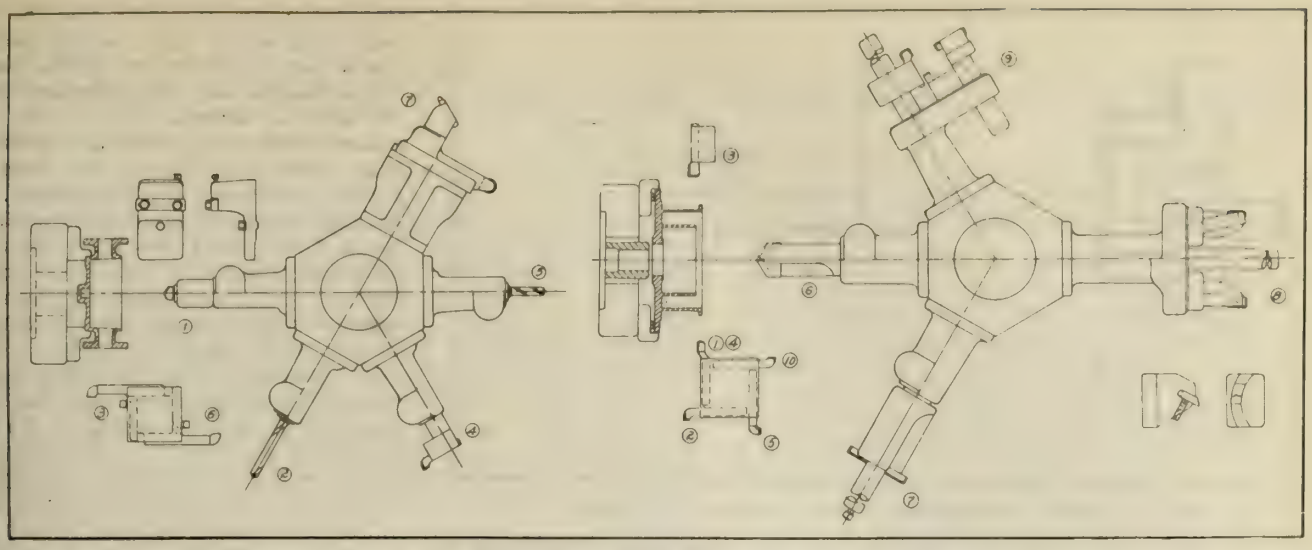

FIG. 2—LEFT HAND VIEW. SHOWING LAYOUT FOR SEMI-ROTARY PUMP BODIES.
FIG. 4—RIGHT HAND VIEW. LAYOUT DRAWING OF DISTRIBUTION CASES.

kind where the work is fragile and there is a large amount of metal to be removed, it is necessary, in order to avoid distortion in the finished piece, to rough out the work all over and then re-machine to finish sizes. In the work we have under consideration this method is used, and the lathe operations are four in number.

Fig. 4 illustrates the lay-out for the first operation, in which the forging is gripped on the large flange. The dotted line round the work shows the shape of the rough material, which is of high tensile steel, and the amount of metal to be removed. Tool No. 1 takes a rough cut along the small diameter of the forging as far as the flange. Tool No. 2 rough faces the large flange, the end, and also rough turns the bead. Tool No. 3 rough forms a gap behind the small flange to allow tool No. 4 to be used for rough turning the small diameter. Tool No. 5 then roughly forms the under cut below the bead. No. 6 is a straight flute twist drill with inserted spiral cutter, which drills right through the flange. No. 7 is a counterbore for opening up and facing the bottom of the large bore; a steady bush in the chuck is provided to pilot this tool.

No. 8 is without doubt the most interesting tool in the lay-out and is provided for trepanning the annular recess. We will consider this tool more closely presently. No. 9 is a combination tool carrying a pilot bar on which is mounted a collar with a facing cutter, taking the second cut in the large bore, and recessing the bottom of the hole. The second cutter faces the edge roughly to length, and a turning cutter takes a second cut over the small flange which is used as a location at the next operation.

### The Trepanning Tool

Fig. 5 shows a close up view of the trepanning tool. The cutters are inserted in two steel holders, bolted to a special flanged holder. The whole arrangement is piloted in the chuck by a substantial bar, and the fact that the cutters are balanced, liberally top raked, and substantially supported, enables a feed as coarse as 88 cuts per inch to be used. The trepanning tool, together with the counterbore used at the first operation, between them remove over 100 lbs. of metal. In the second operation, shown at Fig. 6, the work is clamped back on to a face-plate fixture, as shown. The tooling for this operation is of a comparatively simple nature. Tool No. 1 in the square turret is used to rough turn and face the flange and spigot, and also to rough face the boss. No. 2 is a standard combination tool which carries a boring bar for opening out the ball race and taking a second cut in the small bore. Attached to the combination tool is a special steel holder with a taper form tool for forming the bevelled side. In this case, the scale has been previously removed by a straight cut, and the surface can therefore be finished with a forming tool.

In the third operation, shown at Fig. 7 the work is chucked in exactly the same way as for the second operation, the surfaces corresponding to operation 2 are finished to size. No. 1 is a combination tool carrying a boring bar for taking a second cut in the ball race, and a form tool for finish facing the bevelled side. No. 2 is another combination tool with a boring bar for finish boring the ball race and facing to length. One of the turning heads carries a cutter for

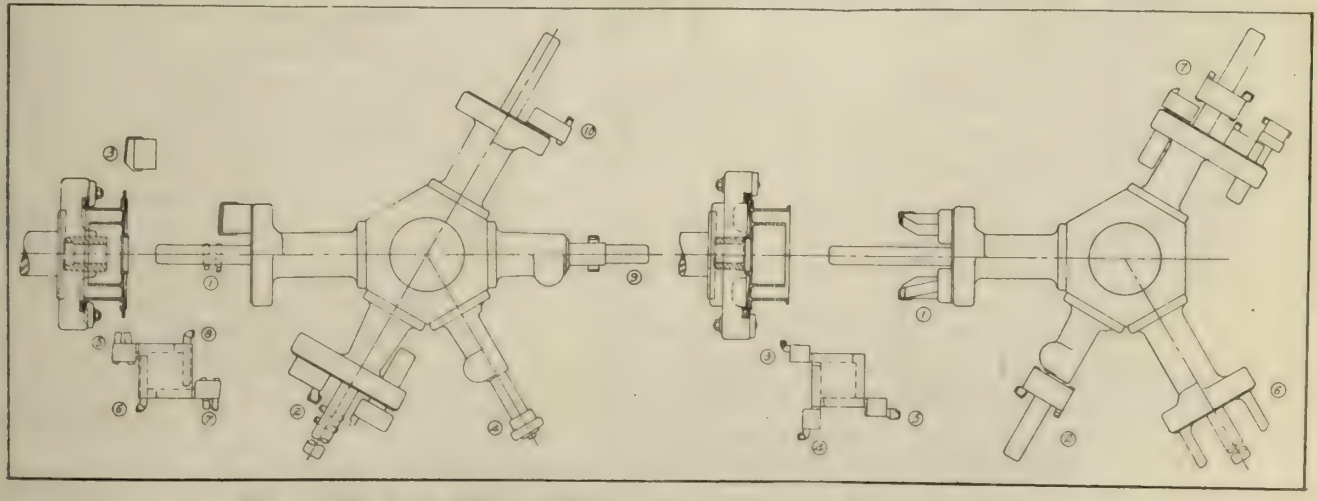

FIG. 7—LEFT HAND VIEW. SHOWING THIRD OPERATION ON DISTRIBUTION CASE.
FIG. 8—RIGHT HAND VIEW. FOURTH OPERATION ON THE SAME PIECE.

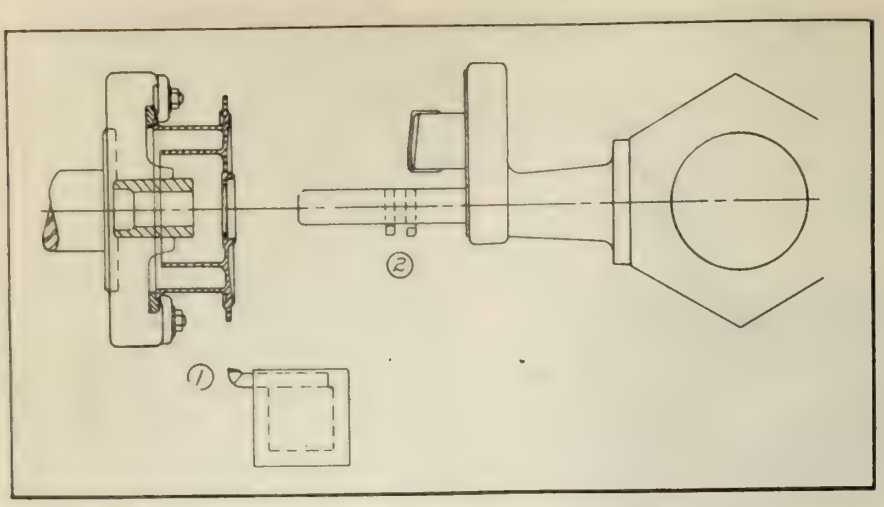

FIG. 6—SECOND OPERATION ON THE DISTRIBUTION CASE.

forming the radius on the boss, and another for finish facing the flat portion on the flange. The taper portion is formed by tool No. 3 mounted on the back cross slide tool holder. No. 4 is a revolving steady peg which is used during the cross slide operations. No. 5 is a duplex tool holder carrying two facing cutters which deal with the sides of the flange. It is necessary to finish both sides of the flange at this operation for the purpose of clamping at the next operation.

Tool No. 6 finish turns and faces the spigot. No. 7 finish faces both sides of the flange, also forms the outside of the beading. No. 8 forms the taper on the outside of the flange. No. 9 sizes the ball race diameter with a floating cutter bar which has been previously described. No. 10 sizes the spigot with a tool in the standard combination tool.

At this stage it will not be out of place to point out that it is advisable in designing faceplate fixtures to be sure that they are sufficiently substantial, so that when the work is clamped up, the fixture itself does not distort under the stresses introduced by clamping. In order to avoid excessive weight, the casting may be cored out from the back, but it should be strongly reinforced by radial ribs.

At the fourth operation a faceplate method of chucking is again used, and the surfaces corresponding to the first operation are re-machined to finished sizes. The tool lay-out is shown at Fig. 8. This view will give some idea of the proportions of the faceplate fixture. This locates from the spigot machined at the third operation. Tool No. 1 is the trepanning tool which is used at the first operation, but with another pair of cutters for finishing both sides of the annular recess. One cutter is set to do the turning and the other does the boring. Each cutter takes care of part of the facing of the bottom of the recess. No. 2 finishes the large bore and faces the edge to length. No. 3 in the square turret finish turns and faces the back of the small flange, and turns the portion in between the two flanges. No. 4 takes sizing cuts on these surfaces. No. 5 finish forms the taper below the bead and a portion of the radius on the bead. No. 6 takes sizing cuts on the inside and the outside of the annular recess with single point bars. No. 7 is a combination tool carrying a boring head with cutters for sizing the large bore and forming the radius on the boss at the bottom of the hole, sizing the small flange, finish facing the edge to length, and chamfering the large bore.

The total machining time for the four operations on this piece is 7 hours, which, having regard to the large amount of metal to be removed, the accuracy required, and the fragile nature of the work, was considered good production when compared with previous methods.

---

**Plant Sold.**—The blast furnace owned by the Atikokan Iron Co. and others at Port Arthur has been sold. The city of Port Arthur, which is a shareholder in the furnace and property, ratified a resolution to dispose of the plant for $1,000,000. Two hundred thousand dollars is to be paid by the purchasers within four years and the remaining $800,000 at the expiration of the four-year term. Two months ago the Atikokan Iron Co.'s mine, said to be one of the biggest producers in the district, was disposed of to Duluth interests. It is understood that the furnace at Port Arthur will be operated in connection with the mine.

# *DATA PERTAINING TO SPHERE*

The surface area of a sphere is equal to 3.1416 times the square of the diameter. Four times the area of one of its great circles. It is also equal to the convex area of its circumscribing cylinder. Surfaces of spheres vary as the square of their diameters.

The volume of a sphere equals .5236 times the cube of the diameter. Also one-sixth of the surface area multiplied by the diameter. Volumes of spheres vary as the cubes of their diameters.

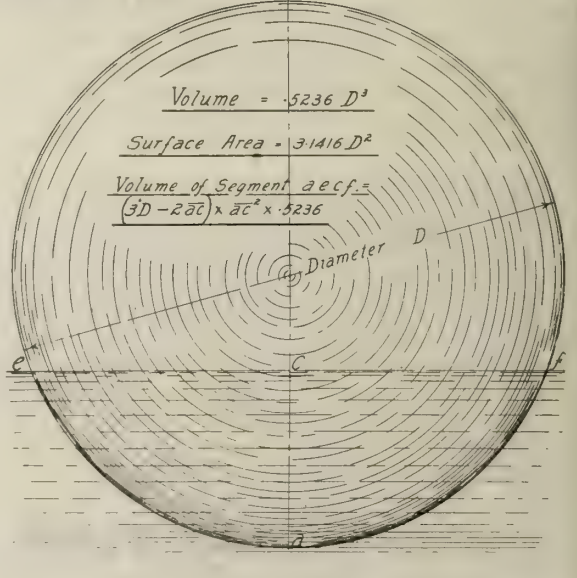
To find the volume of the segment of a sphere.

From three times the diameter of the sphere subtract twice the height of the segment, multiply the difference by .5236 times the square of the height. Or, add the square of the height to three times the square of the radius of the base, and multiply the sum by .5236 times the height.

Example: Diameter of sphere equals 20 inches, submerged to a depth of 7 inches.

Surface area $3.1416\ D^2 = 3.1416 \times 20 \times 20 = 1256.6$ sq. in.

Volume in cu. ft.



$$= .5236\ D^3 = \frac{.5236 \times 20 \times 20 \times 20}{1728} = 2.424 \text{ cu. ft.}$$

Volume of segment when (a c) equals 7 inches.

$(3\ D - 2\ ac) \times (ac)^2 \times .5236 = 46 \times 7 \times 7 \times .5236 = 1180.2$ cu. in.

Weight of water displaced $= .03617 \times 1180.2 = 426.9$ lbs.

Weight of one cubic inch of water equals .03617 lbs.

*Canadian Machinery*

# Improve Your Powers of Perception—Try This Contest

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Only one reader submitted a correct list this week, John McNaughton, Westville, N.S., being the scale winner. Questions 2 and 12 were the ones that caused the trouble. Look at these advertisements once more and you'll see why Mr. McNaughton was correct.

**CONTEST FOR APRIL 28TH ISSUE**

**Contestants are required to write us, stating to which advertisements we refer in this number.**

1—Something that is never behind.
2—How to secure accuracy and a high production rate.
3—Something that is full of practical ideas.
4—A case where you get full value for your money.
5—An example of work worth while.
6—A case where writing, phoning, or wiring, obtains the same result.
7—Something that has proved entirely satisfactory.
8—A product that is made in one piece.
9—Something that you can rely upon on every occasion.
10—Something that is not new, yet is guaranteed.
11—A product said to fit any make of machine.
12—Something that is easily connected.

**These are Correct Answers for List from April 7th Issue:**

1—The Cleveland Twist Drill Co.
2—J. G. Blount Co.
3—H. H. Robertson Co., Ltd.
4—Puro Sanitary Drinking Fountain Co.
5—The Aurora Tool Works
6—D. K. McLaren
7—The Hendey Machine Co.
8—Ford-Smith Machine Co., Ltd.
9—Madison Mfg. Co.
10—National Electro Products.
11—Geometric Tool Co.
12—J. H. Williams & Co.

## Closing Date for This Contest is May 19th

# Milling an Automobile Clutch Shifter Yoke

ROBERT MAWSON

DURING the past few years more attention has been given and experiments made in regard to milling operations than ever before. Present-day competition, which calls for the reduction of manufacturing costs in every line, has made this necessary. The earlier types of milling fixtures were designed to only hold one or two elements, and when these were completed it was then necessary for the operator to stop the machine to unload and reload the fixture. It is easy to see that this meant a loss of valuable time, for when the machine is stopped no parts are being produced. The ideal condition, therefore, would be to arrange the machine with a fixture so that it could be run continuously. Much thought has been given to this subject, and in the present article are shown various fixtures designed for continuous milling.

The illustration, Fig. 1, shows a fixture for milling motor frames used on automobile starters, these pieces being made of cast iron. The operation shown is that of milling the base, and the fixture is designed to hold twelve pieces. The castings are first placed on a stud, which passes through a cored hole at right angles to the surface to be machined. An open washer is then slid over the outer surface of the casting and back of the serrated nut, this being next tightened up by hand. This forces the piece back against a stop pin at the rear of the tool. Between each pair of motor frames it will be observed there is a fixed steel wedge, and on the other side is a sliding wedge. The lower end of this element is made with a notched ledge or shelf, into which is pushed the hook bolt as shown. On the thread of the bolt is placed a shouldered pin nut, and after the bolt and nut have been swung into the position, the operator merely tightens the nut, when the sliding wedge is drawn down.

FIG. 4—DETAIL OF THE CLUTCH SHIFTER YOKE.

The action exerted by this wedge is to force over the casting against the fixed wedge. It can easily be seen that the two mediums of holding, the hand nut in front, and the wedges on top, enable the operator to secure the casting very rigidly against the strains exerted by the cutter. The operator stands in front of the machine and as the finished parts come round he removes them and replaces with rough castings, thus making the milling continuous.

The interesting operation of milling a large casting by the continuous method is shown in Fig. 2. This is an automobile differential gear housing and weighs 40 pounds. The fixture is designed to hold two castings and these are placed in such a position that the operator can replace a finished part with a rough casting without stopping the machine. The casting is located by means of a large plug, which fits into the cored hole through which the drive shaft enters. This plug is fastened to the wall of the fixture, thus affording a fixed locating medium. Two other stops are provided, one at each outer end of the housing. The reader may see one of these by referring to the illustration at the left immediately behind the housing not being machined. The milling operation is performed with the large inserted tooth cutter shown. With this tool set-up 22 castings have been machined per hour. The former method could only realize a production of nine per hour.

The illustration at Fig 3 shows a two spindle vertical milling machine and fixture used for machining automobile connecting rods, the fixture being designed to hold ten forgings. The tool is made with fixed steel tapered block, against which the small end of the rod is placed. The large end of the forging is located in a fixed steel vee block on one side, and half a fixed steel vee block at the other side, at the large end of the rod. A special clamp is next fastened in position, and as this is made with open washers to slide under the bolt the clamp is quickly placed. It will be observed that the clamp is made with a contour of half a vee-block, thus locating and holding the large end of the rod securely. In the centre of clamp is placed a wedge, and as this is slid across the clamp it forces out a steel block against the small end of the rod, this in turn pushing over the small end of the rod against the fixed block. The two ends

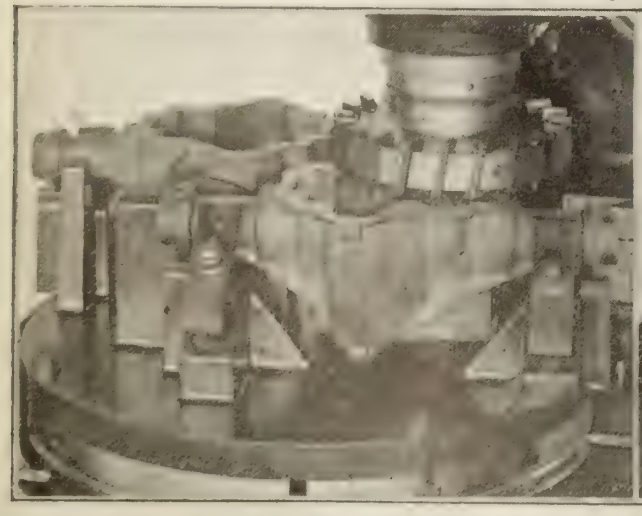


FIG. 2—MILLING DIFFERENTIAL GEAR HOUSING.

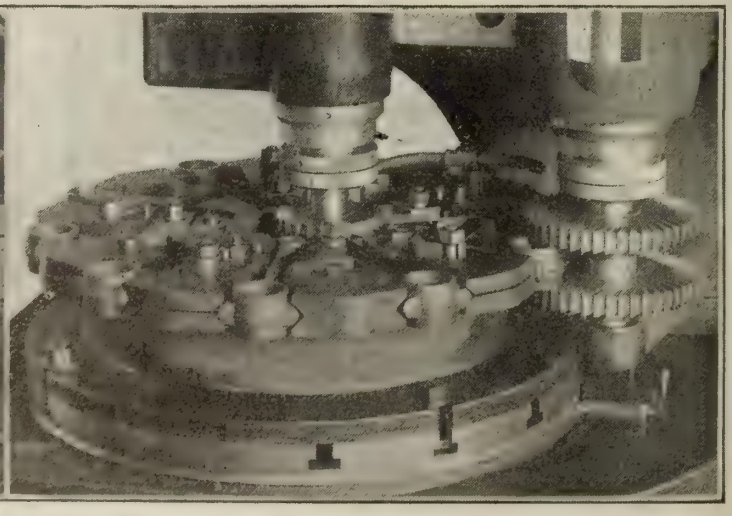

FIG. 3—MACHINING TEN AUTOMOBILE CONNECTING RODS.

of the rod are milled at once, using two sets of gauged cutters accurately spaced, and 90 complete rods can be obtained per hour.

The machining of the element shown in Fig. 4 is of interest, this being a clutch shifter yoke, also used on an automobile. The fixture designed for this work is illustrated at Fig 5. The forgings are placed into the fixture, being located for height by resting on adjustable pins at the lower end; this ensures that the surfaces machined will be in the correct location. The stems of the shifter rods, which have been turned in a previous operation, are located in vee-blocks at both ends, and the U parts of the forgings are placed between two pins to bring the pieces into the proper relative position to suit the cutters. The clamps are then tightened down, as shown. Four surfaces are machined on each forging, the cutters being properly gauged to obtain the correct spacing between the machined bosses.

It will be seen that the machine has been provided with a supporting arm at the lower end of the cutter arbor. This is a very useful addition, as the head is some distance away from the cutters owing to the construction of the fixture, and, further, the material removed is larger than under ordinary conditions where the arbor is only held above. With the arrangement shown the production obtained was 195 complete shifter yokes per hour. These examples will illustrate to the reader the great field yet open for experiment in continuous milling. It will be noticed that the fixtures required are not elaborate and that the increase in production soon offsets any expense that the investigations may require.

## SLEEPING CAR FOR TRAILER WORK

The latest use of the trailer is to adapt it for sleeping and eating accommodation for crews of workmen engaged in line-construction work for the Pacific Telephone and Telegraph Co. in California.

A train of trailers affording comfortable and sanitary living quarters for 35 or 40 men is drawn from place to place by a motor truck as construction work progresses or the work-gang is moved. Each train is made up of two sleeping cars, one combination sleeping car and office for the engineers and superintendent, one dining-car and a combination water-tank and tool car. The motor truck which draws the train of five trailers is detached on arriving at the scene of operations and used for hauling materials, etc. All the trailer chassis are of 2 tons capacity and the bodies are of railway type, 8 feet wide, with sliding windows. Length varies from 12 feet to 24 feet, the longer trailers having reversible or double-end steering control.

## COLORING STEEL

A hot mixture of 1 part black oxide of manganese and 10 parts saltpetre by weight will, according to Mechanical World, act as a good medium for coloring steel articles. The mixture should be heated in an iron pan set in a brick furnace using gas, oil, hard coal, or coke as fuel, and stirred with an iron rod before inserting the piece or pieces to be treated. The temperature may be gauged by immersing a pine stick, which should char without firing instantly. The piece should be moved up and down in the mixture until the desired color is obtained, then washed in hot soda, finishing off in hot water. The quality of the black finish this affords depends to a great extent on the finish of the work. If the articles are hardened, the heat of the mixture will draw the temper somewhat, but it may be restored by finishing off in cold water.

## SPRING MEETING OF A.S.M.E.

The 1921 spring meeting of the American Society of Mechanical Engineers is to be held in Chicago May 23-26 at the Congress Hotel. Well developed programmes will be presented by the professional divisions of the society devoted to Forest Products, Fuels, Machine Shop. Management, Material Handling, Power, Railroad, and an important session will be devoted to Training for Industries. The Chicago committee, jointly with the Western Society of Engineers, is preparing a session on "Chicago as the Rail-Water Gateway."

Visits to a number of points of engineering interest in Chicago will be arranged. Special attention is being given to the correlation of plant visits with the technical sessions. En route to the meeting, the society, jointly with the Society of Automotive Engineers, will stop at McCook Field on Saturday, May 21, for an inspection of the facilities of the field. On May 27-28, the Friday and Saturday following the meeting, a joint excursion with the Army Ordnance Association will proceed to Rock Island Arsenal, where the ordnance division will present papers and enjoy an inspection of the plant.

The programme of the Machine Shop Division at these meetings will be devoted to the effect of the automobile industry upon machine tools and machine shop practice. Four important phases of this subject will be discussed by Henry J. Eberhardt, secretary of the Newark Gear Cutting Machine Co.; Henry J. Hinde, president and general manager, Toledo Machine & Tool Co.; R. E. Flanders, manager, Jones & Lamson Machine Co.; C. B. Lord, works manager, Advance-Rumely Co.

## GASOLINE INDUSTRIAL TRACTOR.

The Barrett-Cravens Company of Chicago, Ill., has recently developed a small heavy-duty industrial tractor capable of carrying a load of 3,000 pounds, and made in a variety of styles to suit the needs and conditions of the different factories. The motive power is derived from a gasoline motor located in the front part of the machine. The drive is transmitted from the engine by means of a straight-line propeller shaft equipped with two universal joints. One casting encloses the rear shaft and the differential gearing, the latter being driven by means of a bronze worm. The wheels are cast solid and designed with invisible hubs to avoid contact with door frames or other obstructions. Wheels are provided with Timken roller bearings. Bumpers are provided at both ends of the machine.

# WHAT OUR READERS THINK AND DO

## THE MONOTONY OF MASS PRODUCTION

By JOHN S. WATTS

AS the mechanical arts advance, additional types of automatic machinery come into being. With this has been inculcated what is known as scientific management. In fact work has been pretty well reduced to the point where the fight for production should be tempered with an attempt to relieve the monotony of mass production.

It is readily conceded that the economy resulting from manufacturing in large quantities is too great to allow us to return to the slower individual methods, nor would anyone in an executive capacity assert tha the modern method of subdividing the work into operations that are repeated continuously does not become monotonous after, say, six months. Yet one cannot very well keep changing operators, for this would result in lower output, and an increase in spoiled material, not to speak of possible damage to the machines through lack of knowledge.

It is also well recognized that the higher the intelligence of the operator the quicker he will rebel against doing monotonous work. To those who perhaps do not agree with me as to monotonous tasks, let me suggest the following: Make rows upon rows of similar figures over and over again. Do not stop to sharpen pencils. Work only with prepared pencils. It will surprise you how soon you tire of the task. Better still, if you have a gang of men working for you at some set operation, take the place of one of these for a few hours, and you'll soon agree with me as to the monotony of it. What then is the solution?

To overcome the monotony by changes in the work, or in the operation, must, perforce, militate against the efficiency gained by the standardization of the work, but it is possible that even so this may be the best solution, and, if so, the point to be aimed at would be to make the changes just sufficiently frequent to make the monotony bearable, thus balance the efficiency lost in changing the work against that gained in retaining the trained operator. In practice this would most easily be accomplished by training each operator to do a number of operations, changing them from one operation to another whenever their efficiency began to fall off through the discontent engendered by the sameness of the work.

To change the method of doing the work would be difficult on operations other than hand operations such as assembling. But it would seem that if an operation has been subjected to a motion study, and the exact motions specified for the operation are followed consistently that the muscles used would from constant repetition of the same action become tired quickly, and that, even from the standpoint of the motion study expert, it would be better to have more than one set of motions laid out, then the operator could change from one to the other from time to time, bringing into action another set of muscles, at the same time relieving the monotony to some extent.

The above covers in a general way the possibilities that are open in the way of changes to the work of the operation, without departing too far from the essential requirements of repetition work.

Let us next take up the question of relieving or counteracting the effect of the monotony by some influence outside of the work. To determine what may be possible on these lines, we would do well to study those things which we do for pleasure, although some part of these things may be monotonous. Take walking. In itself it is a most monotonous thing, being a repetition of the same motion, just as the best examples of scientific motion study. Nevertheless this exercise is about the most universal form of amusement we have.

Analyzing the reasons why walking, though monotonous, can become a pleasure, we find that it is mainly because of what is to be seen during the walk, the pleasure being in the continual change of scene, and the expectation of what is to be seen. The performance of repetition work in a factory under scientific management is analogous to walking through a tunnel in its psychological effects, and the cure may be found in making this work analogous to walking along a pleasant country road or a busy city street.

The fact that we are able to control our muscular actions, as in walking, while at the same time using other of our senses to enjoy the sights, proves that we can think of more than one thing at a time. We may say, then, that it is possible for us to do work, which is simple in itself and calls only for a repetition of the same motions, and which can be controlled by one portion of our brains while the rest are idle, or enjoy some other sensation.

That class of work which requires the whole skill and intelligence of the worker, while being repetition work, cannot be monotonous, as its demands for continual concentration to overcome the difficulties arising furnish sufficient excitement to keep away the feeling of monotony. In fact, it is only that class of work which does not require the use of a fair percentage of brain power which is monotonous.

The operation of automatic machinery, or the execution of work by methods specified by motion studies, is monotonous, because as little as possible is left to the skill of the operator, and the less use that is made of his brains the more successful is considered the operation. Therefore the more we succeed along the lines of scientific management, the more monotonous will the work become.

It would seem necessary therefore to find some means to give this excess idle brain power pleasurable stimulus from outside. I say from outside, because to

### HOW ABOUT THIS?

*Has this story impressed you favorably or otherwise? We want readers' views on this subject, but request that replies be kept as brief as possible. Boil down your suggestions so that we get the real cream of the idea. It is perhaps not generally known that in some tobacco plants in Florida the monotony question has been thought over carefully with the result that a system is installed whereby a competent reader sits upon a raised platform and reads popular novels to the operators, while they are busy on their monotonous tasks. Judging from some of the popular novels we have read, we are of the opinion that this would not help to relieve the monotony—but why go further, for we are tempted to start what Mr. Watts terms a satirical criticism of the system—and yet it has brought wonderful results as far as we can learn.*

leave it to the operator to furnish this stimulus from within himself is to invite disaster. This can easily be proved by a simple experiment, involving the doing of simple work, such as that of a draftsman section lining. This work used up only a small part of his thinking capacity, and if the section lining continues over a large surface, he will infallibly begin to think of other things to keep it from getting monotonous, frequently with the result that he becomes so engrossed in the secondary matter that he fails to control properly the section liner and makes some foolish mistake. Having to furnish some interest from outside the operator, it must obviously be done through one or more of the five senses with which we are endowed, namely, sight, taste, touch, smell or hearing.

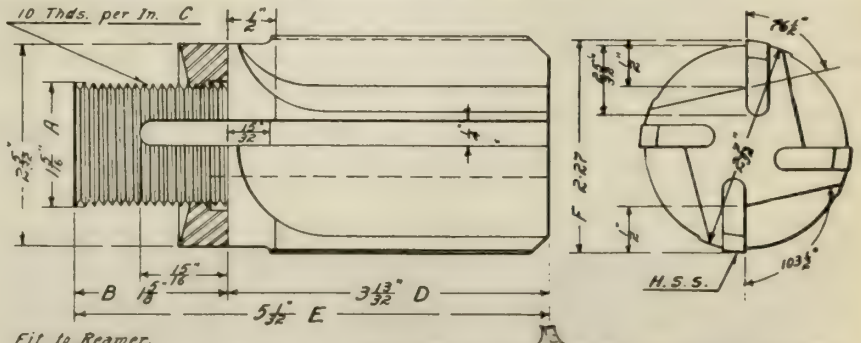
The first, sight, is, of course, absolutely necessary. The second, taste, does not appear to hold much prospects of helping us, as it is obviously impossible to be using it continuously without danger of upsetting the digestion of the operator. It would anyhow be too expensive to feed chocolates to our machine operators, and, on second thought, we find that the operators have tried this themselves, the male ones by chewing tobacco, the females, gum, apparently with some good results, since they continue the practice, but with insufficient results, however, to answer our purpose, since it evidently does not entirely overcome the feeling of monotony. To encourage a still greater indulgence in chewing would be injudicious, as it has been known for operators, under sudden stress, to swallow their chew, with disastrous results to themselves and to the efficiency we are aiming for.

The sense of touch, like that of sight, is practically used up in the actual operation being performed, and is therefore not available for other purposes. That of smell holds possibilities, inasmuch as it is entirely dormant, in most operations (outside of a tannery), but to have a flower bed just outside the window is possible only in summer, and to have a spray of perfume descending upon a disgruntled worker does not appear to me as though it would cause a change for the better in his disposition, although I confess it would be very interesting to watch the effect of unexpected showers of varying perfumes on the operators, from a safe distance, of course.

We have left the sense of hearing, which is generally little used in the actual work, and is therefore available for our purposes. To attempt to use this sense by giving speeches or other spoken entertainment would demand too much attention on the part of the operator and need not be argued at length. The only distraction left is that of music, either vocal or otherwise, and it would seem possible to arrange, where the noise of the machinery itself was not too great, that something might be accomplished along this line, the point to be aimed at being to have the music just sufficiently varied and interesting to take up attention enough to relieve the monotony, without distracting it too much from the performance of the work in hand. That human nature itself seems to point to this as the desired outlet for its superfluous energy is indicated by the tendency to whistle or sing on the part of almost everyone when engaged in some simple, easily performed task. This whistling at work is an unfailing indication of the progress of the work, as when you hear a man whistling you may know he is progressing easily, but let him strike a difficulty and instantly he ceases to whistle and puts his whole mind to the solution of the problem before him and will not recommence his song until the difficulty is overcome and plain sailing is before him again. The action is automatic, the whistling ceasing precisely when its need ceases and recommencing whenever required, without in the least unduly distracting the attention from the work in hand.

When we come to think it over, we find that the military have used this idea for a long time, by having their own bands accompany the regiments on their marches. In the European war when it was impossible to have the bands accompany the soldiers, it was found a great help to start the soldiers singing when the tedium of a large march began to tell upon them. If, then, we had a leader, human or mechanical, to lead in the singing or whistling, whichever appealed to the individual operator, each one would naturally, without thought, join in, or drop out, just as the demands of his work upon him required, and sufficient variety be injected into the day's work to relieve the strain of monotony.

I strongly appreciate the possibility of someone writing a very humorous satirical criticism of the above, indeed I must confess to an insistent temptation to do it myself, as the possibilities of a really funny skit on this proposal are too good to lightly pass over.



Nevertheless I put forward the idea, in all seriousness, as one that holds the solution of what is becoming a serious problem.

# Reamer Data

An inserted blade reamer, to be a success, must be rigid. After many experiments, here is the type of reamer adopted by the International Harvester Co., Ltd., at Hamilton, Canada. As will be noted, certain proportions are adhered to, and the construction in itself is rather novel.

For efficiency in milling of blade slots, the washer as shown was made. Previous to that, the slots could not be milled far enough to allow the blade to sit down correctly, but now the slots are milled slightly farther than necessary and the washer on assembly takes the thrust of blade. A study of this style of reamer will well repay mechanics in general.

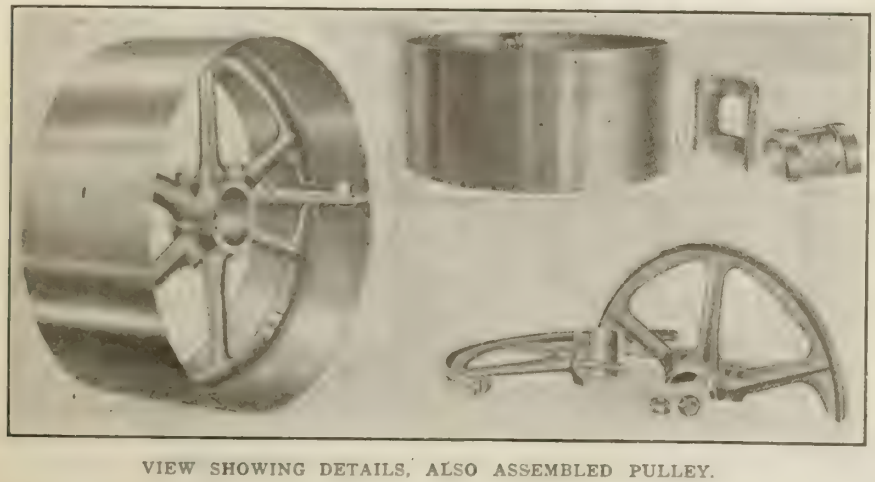
HERE WE HAVE CONDENSED INFORMATION OF REAL VALUE. CLIP THIS OUT FOR FUTURE REFERENCE.

# DEVELOPMENTS IN SHOP EQUIPMENT

## SPLIT BELT PULLEY.

The S. K. F. Co., Ltd., Toronto, Canada, have placed on the market a line of new split belt pulleys which have some special features well worth mentioning. These pulleys are made in sizes from 8 inch to 60 inch diameter, these having a difference of 1 inch up to 24 inches, of 2 inches up to 40 inches, and of 4 inches up to 60 inches diameter.



Standard interchangeable rims are made in widths from 3 inches to 9 inches, increasing by 1 inch for pulleys with single spyder, and with flat or crowned faces. For belts of greater width, pulleys having two spyders are made with rims 11 inches, 13 inches, 16 inches, in one width, and with flat face only.

Reference to the illustration tells the story in itself. As will be noted, the pulleys consists of the following parts: A cast iron spyder made in two similar halves is provided with suitable fastening bolts. These halves are machined to receive interchangeable shaft bushes, or S.K.F. ball bearings of the adapter type as necessary. The periphery of the spyder is machined and a groove cut to receive the snugs (as they are called) formed in the rim by press tools, this, of course, preventing lateral movement of the rims. The adjacent ends are notched to locate rim balance weight.

The rim is made from suitable quality steel to withstand high tensile strength, and is finished by cold rolling. The ends are flanged and pierced to receive the two stretching bolts. A balance weight of sheet iron is placed within the rims when assembling, and is located by notches as already mentioned. No shaft keys are required on this style of pulley as they are intended for line shaft drives to machines or main drives to line shafts from electric motors.

The chief feature in this pulley is the interchangeable rim. Its advantage is self apparent, for rims up to 9 inches wide are interchangeable with those of lesser width on the same spyder and bush where necessary. Intermediate drives to line shafts, up to 2½ inch diameter, originally installed for continuous driving, may be converted for intermittent use by the substitution of a wider rim with flat face on the driving pulley, and the addition of a second driven pulley with crowned face, into which may be inserted ball bearings of the adapter type to carry the belt as a loose pulley.

It might be imagined that the adoption of the bushing system without keys would limit the use of these pulleys to light duty drives. However, this is not the case, for the company claims that they recommend with confidence these pulleys for main drives which are reasonably steady, such as those from electric motors to line shafts, driving machines in groups where a main belt is working at 3,000 feet per minute, or more; for instance, a line shaft speed of 250 r.p.m. transmitted through a pulley 48 inch diameter. It is, however, in the case of line and countershaft pulleys, where these pulleys will find their greater scope.

VIEW SHOWING DETAILS, ALSO ASSEMBLED PULLEY.

## DRILL GRINDING MACHINE

The Bickford-Switzer Co., 50 Norwood Street, Greenfield, Mass., has recently placed on the market the drill grinding machine as illustrated. This machine is intended for the sharpening of twist drills from ⅛ inch up to ¾ inch diameter. Drills can be ground commercially perfect at considerable speed, according to this company's literature, and it is said that a drill ground on this machine will not cut more than .002 inch larger than its own size. One minute only is required for setting up and grinding. The drill is held in a chuck, and by turning a crank is given a combined rotative, eccentric and swinging motion. The two lips are brought consecutively in contact with the wheel, with the result that when one lip is sharpened or ground to a certain point, the other is also. The grinding is said to be always central and true with the axis of the drill. The shank end of drill is held by means of a cup center, while the front end is held by two jaws which locate and grip the body of the drill.

DETAIL OF THE DRILL GRINDER.

The abrasive wheel is enclosed in a guard, and driven directly by means of a

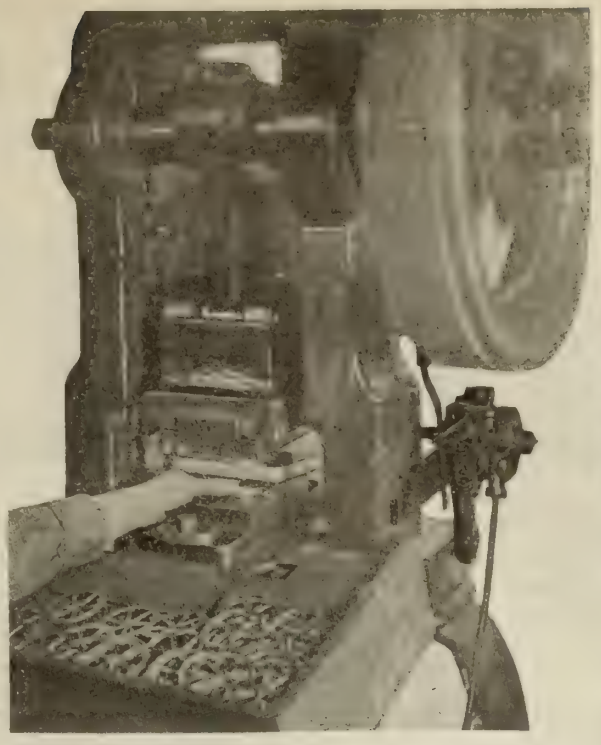
mall electric motor, which can be furished for either direct or alternating urrent. It can be fed towards the drill, eing sharpened by means of a small andwheel.

After clamping the drill in place in the huck, the carriage on which it is mount-d can be moved toward the wheel by neans of a hand-lever moving horizonally. The crank at the left is then urned, so as to produce the necessary notion of the drill. In this way the oint of the drill is ground and sharp-ned. The mechanism is arranged so hat it is also possible to bevel off the enter corners of the cutting lips, it be-ng stated that this method increases the endurance of the drill.

### SAFETY PRESS GUARD

Kartzmark and Sons, Hamilton, Ont., have placed on the Canadian market a new press guard known as the Kartzmark safety guard. This guard, although well known in the States, has never been brought into Canada until the present time. Various firms on the other side have them in use at present.

The illustrations shown herewith show its general characteristics. The guard works with the press. At the downward movement of the treadle of the press, the guard moves down. It must go down all the way, that is, it must go down and settle over the block of the die, for the latch on the guard remains locked until it does. As will be noted in one of the illustrations, the operator's hand upon the block locks the latch we speak of and halts the hammer. In this way the careless operator receives nothing worse than a slight squeeze for his carelessness.



It is stated by the manufacturers of the device that production is not deterred through the use of the guard, but 15% to 35% additional work has been obtained in many cases. The positive self-guarding features and mechanical construction of this guard are fully protected by suitable patents.

### BALANCING AND DRILLING MACHINE.

A combined balancing and drilling machine has been added to the lines manufactured by the Rockford Tool Company of Rockford, Ill. It is designed for the final balancing of crank shafts and flywheels after they have been assembled. The same fixture may be used for similar operations where the flywheel is carried on an arbor or mandrel. In the latter instance the drill passes through a bushing in one of the standards which guides it to the work. Ball-bearing spindles are provided for the balancing discs, which are made of hardened steel. The machine can be arranged for belt or motor drive.

### SHAPER GUARD

The Lang Manufacturing Co., Guelph, Ont., have placed on the market a shaper guard as shown in the accompanying illustration. This is known as the Whetstone guard, and it is for use on all classes of woodworking. The fixture requires only one hole in the work table, and is said to give the worker absolute protection against the revolving knives. The guard has a swivel arm as shown, and can be adjusted to any angle, at the same time holding down the stock securely. The fixture is equipped with a roller of rubber for finished stock, also with a shoe for working on long stock.

SHOWING HOW THE PUNCH CANNOT INJURE THE HAND.

## The Rate of Wages

IT is, perhaps, only natural that labor should make a fight to maintain wages that were paid during war years.

The trouble that is being experienced to-day in readjusting wage schedules to conform with to-day's conditions is the price we are paying for ever allowing war work to get on a money-grabbing basis.

Once a man gets his wages on a higher level, he brings up his home conditions—and when there is danger of this increase being taken away, he has the backing of the home to a large extent in resisting such a move.

A man who is employed has only one thing to offer for sale, viz., his labor power. It makes no difference in what capacity he comes. He may prefer the word "ability" or "services" to "labor power," but it is a distinction without a difference.

He sells his labor power according to the market value, the same as any other commodity is disposed of. If the market is in his favor, then he is in a seller's market and can get his price. If his commodity, labor, is a drug on the market, then it is a buyer's market, and the man who has labor to sell ceases to be in a position to dictate either figures or terms.

There may be some exceptions to these rules, but they govern the great majority of cases.

To-day the buyer of labor is in control of the market and he has to regulate the price he can pay in accordance with the price at which he can sell his finished product in the lowered markets of the world.

We are all subject to certain economic laws and little is to be gained by trying to make ourselves imagine they have ceased to operate.

---

Every speaker of any prominence who assays to discuss public affairs has told us what is wrong with our National Railways. And summed up, the address runs like this: "The C.P.R. is a well managed affair."

## An Evening Well Spent

HAVING answered the questions in the weekly contest in Canadian Machinery, an official of one of the leading machine tool firms in United States writes: "Your contest is all that you claim, and it proved to be not only interesting, but constructive as well, which no doubt is a view taken by many of your readers. Your magazine afforded me many hours of interesting reading and it was not until I had read every article that I decided to try the contest. I considered it an evening well spent."

## A Need of the Times

SELDOM has such a straight and accurate analysis of conditions been presented as that contained in an address by James S. Alexander, president of the National Bank of Commerce in New York. Addressing the National Association of Cotton Manufacturers at Boston, he made use of the following:

"Too many people to-day hope and expect something will be done for them although their interests would be best served by their doing a full day's work for their pay. There is an effort on the part of workers to retain the advantages won during the abnormal war period of shorter hours, higher pay and easy work, regardless of the present lack of an economic basis for the continuance of such conditions. The fundamental principle of enlightened labor leadership to-day should be to inculcate a return to the doctrines of an honest day's work for an honest day's pay. Inflated wages and the non-competitive conditions of the war and the later boom period produced inefficiency and irresponsibility.

"It is essential to the welfare of labor itself to banish this attitude, not because individual efficiency and a full return of value received in the pay envelope mean bigger profits for the employer, but because they mean better times for the workers themselves. Workers cannot, in the long run, consume more than they produce. If wages are too high in relation to the exchange value of the product, wages must come down, for no wage can be permanently maintained at a point above what it is worth measured in terms of other products.

"Further, employers must not seek to drive wages below their true value thus measured. There is this reciprocal personal responsibility involved in the relation of workers and employers,—on the one hand to render efficient service for every dollar demanded, on the other to render over to labor every dollar earned."

Not only is there a responsibility for employers and employees, but also for merchandising business in general. Without the active co-operation of retailers to quickly give consumers all possible advantage of lower prices, it is going to be a hard matter to make wage adjustments on a fair basis and unless they are made on such a basis, they are going to be neither satisfactory nor permanent.

---

## Some Good Issues Coming

MAGNETIC chucks will be discussed in an interesting article in May 5th issue of Canadian Machinery. The particular consideration will be their application to surface grinding. The magnetic chuck is coming into its own in the mechanical field in a way that would surprise and amaze the old-timer.

Then in the issue of May 12th, roller bearings in industry will be featured. This is a matter that should be of particular interest to executives generally.

An expert in the business is furnishing the leading article for May 19th, which will deal with the method of gear shaping automobile gears. Various fixtures used in doing this work will be shown.

Every issue has something of direct interest to the practical shop man.

## EFFICIENT FOREMEN GREAT HELP IN RUNNING THE SHOP

**Mechanic Needs to Have a Good Training and Education to Live Up to His Opportunity**

By N. W. K.

"WHAT is the greatest problem you have to face in the management of your plant?" I asked Mr. Kenneth Dunn, superintendent of the McClary Mfg. Company.

"The difficulty of obtaining good foremen," was the immediate reply. "And what I mean by good foremen are men who are fully trained, both technically and as executives—men who can figure on estimates and costs, understand time chart principles—in other words, men who can be relied upon to administer their different departments efficiently."

Mr. Dunn went on—"The trouble with the average foreman of to-day is that his early education has been sadly neglected. That's not the man's fault. It's the fault of the educational system. By far the greater number of to-day's foremen started to serve their apprenticeship at very immature ages, many of them just at the age when they should have been developing their brains instead of their arms.

"You know, I am a firm believer in every boy being fitted for life with a proper education. Every boy should have at least a few years in high school. A great many of the things we learned in high school were looked upon by us at the time as unessential, especially," he continued, "subjects like Latin, Greek, algebra and numerous other studies so irritating to the average boy. But in reality subjects of this sort are splendid brain food and teach a boy to think for himself, a faculty with which every man must be endowed if he is to go far in the industrial world to-day.

"The manufacturer of to-day wants as foremen men with brains who know how to apply them. Keen business competition demands this. Every effort is being made to cut down costs and excessive costs are in the main due to inefficient methods and wastage of material, due to ignorance on the part of the employees. Now it's up to the superintendent to see that a plant is run economically and efficiently, but where he has many different departments in his care he must depend on his foremen and if these fail through lack of education to keep their end up, well, something's going to happen."

"Do you think an intelligent reading of technical books and papers would go far towards solving the trouble?" I asked.

"Well, yes, to a certain extent," he replied. "Personally, I'm a great believer in technical papers and subscribe for a great number. What I have in mind, however, is an improvement even on the technical paper. Some of the most prominent American universities, such as Yale and Columbia, are strongly advocating the training of promising workers in the various branches of industry who will later develop into good executives. This matter has received the co-operation of many of the leading American manufacturers, who are sending some of their more promising workers to these universities, where special courses of study in executive and higher technical training are given. I am firmly of the opinion that this will become a regular practice with our own Canadian manufacturers when such courses take their place on the regular curriculum of Canadian universities."

---

"Iron Age"—Workers at many iron and steel plants have accepted reduced wages; lower prices have been named on many iron and steel products. Farmers have seen the prices of their products decline until all profit on their 1920 crops has been wiped out. Both manufacturers and wage earners in many lines are now looking to the railroad workers to accept such reductions as will make possible a lowering of freight rates and aid in the readjustment for which the whole country is waiting.

## A Man of Many Parts

IN an appreciation of the late C. E. Duncan, general superintendent of the Algoma Steel Corporation, appearing in "The Algoman," of Sault Ste. Marie, is the following:

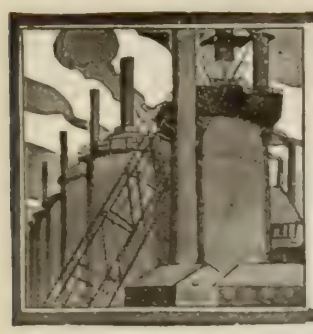
"To many, Charlie Duncan was a formidable man, a man hard to meet, hard to talk to; they feared him. But humanity being the peculiar characteristic of all great men, he was an eminently human fellow—in fact a great big boy, in heart. True, he was gruff and abrupt, at times; his was a rapier tongue in repartee; he was a great judge of human nature and a great manager of men; he knew the steel game from top to bottom; he detested subterfuge and camouflage; it was useless to try to resort to such with him. They wouldn't pass muster. He knew all the tricks. The only way to corral his interest and goodwill, was to go absolutely straight with him. Then he became your backer and friend and champion against all comers.

He dearly loved a fight, even for the fight's sake or to try out the mettle of a subordinate and he well nigh despised any one who feared him. He told the writer an incident illustrative of this, some weeks before he died. He said that, once, he had had occasion to give a department head a "raking over the coals" about something. This latter felt very badly over it and came to his office almost in tears, to explain the matter. "Do you know," he proceeded, telling of it, "I'd have thought ten times more of that chap if he had burst open my office door, thrown his hat on the floor, jumped across my table and bearded me, saying,—'See here, Duncan, d—— you, what do you mean by jacking me up this way?'"

---

## Using the Bulletin Board

THE use of a bulletin-board as an educational feature is a valuable asset when utilized in a common-sense way and without fear or favor. At a time when business conditions make changes in the plant necessary much of the fear of these changes may be removed by the right kind of explanation on the bulletin-board. J. H. Lloyd, in "The Iron Age," comments as follows:—



"Within six months after bulletin-boards were placed in a forge shop every one of 155 men was converted to bulletin-board principles. Increased production resulted, and there was a material decrease in the consumption of fuel oil, fire brick, light, and so on. At the end of every month letters from the assistant manager, showing what had been accomplished in cutting costs, were posted on the bulletin-board, so that all could read them. A bulletin-board exerts the same power that a newspaper does."

---

WRITING to the Brantford Expositor recently on "What Is Brantford's Greatest Need," A. B. Muir, of the Goold, Shapley & Muir Co., says: "Brantford's greatest need at the present time is for the farmers to stop holding off from buying the implements they are in need of, with the expectation of a big drop in agricultural implements. Generally speaking, manufacturers have been hit hard the past few years by the great increase in raw materials and wages, not being able to increase their prices in proportion. Most of the farmers have made their old machines hold out longer by repairing. Perhaps a number borrowed their neighbor's and some rented others. This is the chief reason for the slump in employment and industrial stocks at the present time."

---

ON the front cover of Canadian Machinery is a little "Read and Pass On" table that is becoming quite popular in a number of shops where the paper is send from one department to another. Very often one member of the staff will see an article that he knows will interest some person in the organization—it probably contains information he should have. The little "Pass On" table makes it easy to send this on through the office mail in the usual way.

# MARKET DEVELOPMENTS

## Only One Recognized Steel Market is Left Now

### Prices Have Been Equalized, And it Seems Certain That There Will Be No Change For Some Months to Come—First Month In Second Quarter Shows No Marked Change

THE first month of the second quarter has passed, but there has been no noticeable change in business in the iron, steel and machine tool market. There are lines where the new prices of steel will not be felt for some time to come. Implement makers, for instance, will in many cases not be using the lower priced steel until well on in 1922, as they have a lot of stock on hand to be worked up and also a large supply of machines made up but not sold. Many other industries are situated similarly.

Canadian steel merchants are not finding any difference in their bookings since the new prices came into effect. There seems to be a feeling that the schedule will hold for some months to come and from this there is no doubt more strength to the market that will have a tendency to keep prices from sagging, but there is still a lot of material on hand that merchants are anxious to clear out at whatever they can get for it. Buyers are always keen to try and build market values around a cut price that may have very little relation to actual conditions at all.

Machine tool trade is quiet and the bringing out of quite a lot of used equipment is not helping the sale of new machines.

An official of the largest firm of scrap metal dealers in the Dominion puts forward an interesting claim for his business this week. He remarks that fully fifty per cent. of the dealers have gone out of business during the past few months and adds: "There will be no improvement in business until there is an improvement in the scrap metal trade. Iron and steel will not move well until the iron and steel scrap lines have started to rise. The same will hold true in regard to copper. It has happened in every period of this nature before. Coming events cast their shadows before, and they fall in the scrap yards. Watch and see," he concluded.

## VARIED REPORTS COME OUT ABOUT CONDITION OF TRADE IN MONTREAL

Special to CANADIAN MACHINERY.

MONTREAL, April 28,—The steel situation in this district has steadied considerably following the adjustment of prices by the United States Steel Corporation. There have been no pronounced signs of increased buying, but the added confidence that has been created by the knowledge that price quotations have become more uniform will probably have the desired effect upon the trade. There is no definite assurance that prices are as low as they will go, but it is almost certain that no further reductions will be made for some time.

"One thing that has developed as a result of the lowering of prices by the Steel Corporation," said a dealer here, "has been the establishment of fixed prices on many lines of commodities. The range of quotations that prevailed a few weeks ago has practically disappeared, as nearly all the independents have adopted the figures set by the Corporation. We tried to purchase a lot of plate from a mill that a couple of weeks back were quoting around $2, but were advised that the price was now $2.20. Reports seem to confirm the belief that the Corporation's quotations on plates are now quite general." When asked as to the possible period through which this new price list would be effective, the dealer would not commit himself. "We would not care to make a prediction as to the duration of these quotations, but it is reasonably certain that no material change will take place for some time. The labor question is still unsettled and this is the pivot on which conditions swing. The new price quotations may be based on premeditated action regarding labor, and if so, prices may remain unchanged even after labor is cut; but on the other hand, it would not be surprising to see a further decline before midsummer."

Apart from slightly increased inquiry the market has not been affected by the developments in the States. Dealers here state that the motor trade is more active and that sales have increased to some extent, but general demand for other lines remains unchanged.

#### Machine Tool Inquiry Improves

The varied remarks of dealers as to the business being carried on makes it difficult to define, with any degree of accuracy, the present status of the machine tool situation. The statements range from "very dull" to "the best week we have had this year." These conditions, however, could be likewise qualified, particularly the latter, as the "best week" might be considerably below what would be thought normal for this time of the year. Apart from the actual receipt of the orders, there appears to be a better tone regarding the summer's business.

"We have had some good inquiries," remarked a dealer, "and are expecting that they will be followed by business very soon. We have disposed of quite a bit of wood working machinery and construction equipment during the past few weeks. Metal working lines are not very active but a fair volume is still moving."

#### Non-Ferrous Lines Back

Aside from the fact that scrap quotations on non-ferrous lines have been revised upwards, after a couple of weeks at what might appear ridiculously low prices, the market has developed nothing of exceptional interest. The low prices quoted brought few inquiries owing to the fact that the trade is not buying and producers of scrap have little available material. The dullness of trade at the present time makes price a secondary consideration. Scrap dealers look for a quiet period throughout the summer, and do not anticipate any marked change

until steel industry in general becomes more active. Dealers are quoting 8½ cents on light copper and from 10½ to 11 cents on other grades. Medium brass has returned to 5½ cents per pound. Steels are quiet with few changes. Machine cast iron is quoted locally at $22.50 per ton, and car wheels at $25 per ton; these are the only changes.

## MOST ORDERS ARE FOR SMALL AMOUNTS

**Scrap Markets Have Only Half the Dealers That Were In a Few Months Ago**

TORONTO.—The machine tool trade moves slowly. In some places one hears reports of a better month's business than was done during the same period a month ago. None of these claim anything big in the way of sales or prospects, and at best they are running well behind the showing of last year.

If business is going to come as a result of the salesmen going after it, there should be some returns shortly. Anything that looks like a prospect is being cultivated to the fullest extent, and the chances are that any known prospective buyer knows more about machine tools now than he ever did before, that is if he has given a hearing to all the men who have started in his direction.

Fortunately the warerooms in this district were not carrying much stock when the recent reductions in prices were made. During the last year or so of the war, and for a year after, it was almost impossible to place a stock order for any of the well-known makes of machine tools, the makers insisting that dealers should be supplied only with bona fide sales shipments. While this seemed a poor condition at the time, it has since worked out for the best, as dealers have not had the trouble of having to dispose of high-priced machines after the makers have announced reductions.

The sale of small tools is limited to actual needs. In some cases dealers are hardly getting the trade that would come in the ordinary way. There are several shops that have close working connections with others, and supplies are shipped from one to the other, in order to make available supplies last as long as possible. An anxiety to get high-price tools worked out may also have something to do with this habit.

Carbon drills are in demand in many of the orders that are going through now, which means that the turnover of the dealer is smaller owing to the lower price of the carbon as compared with high-speed. For instance, half-inch carbon drills are selling at $1.86 against $7.35 for high-speed in dozen lots.

### Steel Markets Spotty

Steel merchants differ in the reports they have to offer about the business that is being done in their warehouses. Some of them have made good progress in the work of getting rid of their stock, while others are still busily engaged in selling off. It is this practice of clearing out that makes it harder than usual to state market figures that will be found correct under all circumstances. Some of the warehouses that find a chance to get rid of a large tonnage in a line they do not wish to handle will give a close figure in order to move it out. In other cases the stock, which was taken in when dealers were glad to get anything that looked like steel, is not up to the standards in the way of size and length. A close price is not a market price, but it is remarkable how these few low prices that have been given are carted around the market, and what publicity and prominence they receive. The fact that one lot of bars was sold in this market at 3.40 was picked up by the writer at a number of points. As stated before in these pages the new market for bar mill material must be built around 4c., and it is difficult to see how, having regard to new prices and present costs of doing business, a profitable trade can be done at a lower figure.

Orders continue to be small in the steel warehouses. Perhaps the limit was reached when one of the yards sent out an order that weighed four pounds.

### Gets Some Business

Another warehouse had advertised a certain line in several papers, and followed this up by a circular letter. A few days after a salesman started out to follow up in the next step, and a certain amount of business rewarded the effort.

Still another dealer, commenting on this, says: "It takes more than a low price to close the business just now. The low price can pretty well be taken for granted. Any salesman who goes out now is empowered to name a low figure, but it takes real selling plus the low price."

Some of the merchants from the steel market have found out that during the pressure of a year or so ago some of the smaller industries, when they had an opportunity to buy, took on a much larger tonnage than they can get away with now with business moving on a much lower scale.

### Number Dropping Out

A representative of one of the largest scrap metal yards in the Dominion is authority for the statement that about 50 per cent. of the scrap metal yards in the country have gone out of business during recent months. "Only the well-established yards can stand such a period as we have been going through, and there is nothing to indicate an improvement. The scrap metal market must improve before other lines do. This may seem to be a queer statement, but it is an absolute fact, and anyone who watches markets over a period of years can prove that it is so. Until the prices of iron and steel scrap strengthen you are not going to see an improvement in the lines into which these go. Until the copper market gets better you are not going to see an improvement in the lines into which copper goes. Coming events cast their shadows before, and they fall right in the scrap yard. Watch and see," was his parting advice.

## POINTS IN WEEK'S MARKETING NOTES

**Pittsburgh reports that the whole steel market is now equalized as both the Corporation and independents are quoting the same prices.**

—

**The independent steel mills are rolling about 40 per cent. of their capacity now against 32 in March and 30 in February.**

—

**Small tools are moving slowly just now. Some English made drills are selling below the Canadian-made article.**

—

**The process of clearing out stocks in the steel warehouses is still going on and a good many sales are made at prices that do not reflect actual market conditions.**

—

**The scrap metal market continues poor. It is estimated that at least 50 per cent. of the dealers have gone out of business during the last six months.**

—

**The largest dealer in scrap metals in Canada makes the interesting claim that there will be no improvement in the iron and steel business until there is a strengthening in iron and steel scrap prices.**

## PRICES HAVE HELD BUILDING BACK

**Cleveland Prospects May Change After the Matter of Wages Comes to a Showdown**

CLEVELAND, April 27.—One reason for the slump in American business is the high building labor cost, and the refusal to lower the same. The Cleveland Street Railway employees took a reduction of 20 per cent., in fact they volunteered to put this into effect, but the building trades are holding out, and May 1 will see the climax when present contracts expire.

The following are some of the rates now in effect on some of the trades:

Plumbers, steamfitters and electricians, $1.39½ per hour.

Carpenters, bricklayers and steel contractors, $1.25 yer hour.

Hod carriers and laborers, $1 per hour.

Cleveland has through sheer necessity completed this last year some large office buildings, five theatres, and also has several under construction. Other than from sheer necessity nothing has been built since 1916, but after the fight on May 1 there will be a revival in building and conditions will improve.

# INDEPENDENTS HAVE PICKED UP AND ARE RUNNING AT BETTER RATE

Special to CANADIAN MACHINERY.

PITTSBURGH, April 28.—Practically the whole steel market is now equalized as between the Steel Corporation and independents, as both parties are quoting the same prices, and the market may also be considered stabilized since there is very little chance that in the near future the Steel Corporation will reduce its prices farther or that the independents will cut prices.

Steel prices are now quotable as follows:

| | |
|---|---|
| Billets | $37.00 |
| Slabs | 38.00 |
| Sheet bars | 39.00 |
| Small billets | 39.00 |
| Forging billets, f.o.b. Pittsburgh or Youngstown | 42.00 |
| Rods, Pittsburgh | 48.00 |
| Bars | 2.10c |
| Shapes | 2.20c |
| Plates | 2.20c |
| Hoops | 2.75c |
| Wire | 3c |
| Wire nails | $3.25 |
| Standard steel pipe | .....62½ per cent. basing discount |
| Blue annealed sheets | 3.10c |
| Black sheets | 4c |
| Galvanized sheets | 5c |
| Tin plate | $6.25 |

### The Steel Corporation

As to the future of prices, it is plainly the present policy of the Steel Corporation not to reduce its prices farther, until conditions change fundamentally. The Corporation would hardly reduce prices farther without reducing wages, and it does not desire to do this, at least at present. There is a possibility that it would be disposed to reduce wages after two adjustments now in abeyance are made, these being wages and working conditions on the railroads and in the building trades respectively. However, even at that the Steel Corporation might modify its wages considerably without furnishing a basis on which a reduction in its selling prices could be predicated, because it contemplates at some time eliminating the twelve-hour day, though not necessarily by replacing it with a straight eight-hour day as carelessly assumed and commonly reported, and in that way incomes of men might be reduced without the wage cost of producing steel being made less. The Corporation has absorbed several large items as it is. The Industrial Board prices of March 21, 1919, being regarded as fair, the Corporation has:

(1) Absorbed the wage advance of February 1, 1920.

(2) Has absorbed the freight rate advances of August 26, 1920.

(3) Has absorbed the recent reduction made in its selling prices from the Industrial Board schedule.

### The Independents

The independents are in no mood to indulge in another crusade of price cutting, for several reasons. The recent cutting, from about the beginning of February to the early part of April, did not bring them much business, and it is plain now that there is not a great deal of business to be had, not enough to give them an economical operation. If they had a light operation at present prices and could get a full operation by cutting prices slightly it would pay as their costs would be greatly reduced, but the additional business, if any at all additional could be secured, would not give them enough lower cost to justify the concessions. This is the theory, one that all the independents subscribe to now, but, of course, it does not follow that the independents will never cut prices again. They may become restive after a time, or suspicious of each other.

### Manufactured Steel

Some manufactured steel products, made from the regular rolled steel products of the mills, have lately been reduced, and a little summary may here be given, the following prices being those now accepted as representing the market:

| | |
|---|---|
| Standard railroad spikes | 3.30c |
| Small spikes, ½, 7/16 and ⅜-inch. | 3.65c |
| 5/16-inch. | 4.25c |
| Boat and barge spikes | 3.85c |
| Track bolts | 4.50c |
| Cold finished steel bars | 3.10c |
| Cold rolled strip | 5.50c |
| Button head structural rivets | 3.50c |
| Cone head boiler rivets | 3.60c |
| Chain, 1-inch proof coal | 6.35c |

Some of these prices are more or less in keeping with the prices of the rolled products from which they are made, but others show much larger percentage spreads above the raw material than obtained before the war. That is probably true of the majority of things made from steel, so that the ultimate buyer, who is the real consumer, does not get the full benefit of reductions the steel mills have made. While the steel mills never think of criticizing their customers in a matter of this sort, it is obvious that the actual consumption of steel, if to any extent it is regulated by the price the consumer must pay, is not entirely subject to the dictation of the steel mills, in their making of prices at which they will sell their products. In some quarters outside the trade, including some banks and John Skelton Williams, former controller of the currency, there has been criticism of the steel mills for not reducing prices, on the ground that the steel producers could broaden the consumption by reducing their prices. This criticism, it will be seen, is not altogether well directed.

### Orders

The independents seem to have corralled a fair-sized lot of business as they were withdrawing their old prices and advancing to a somewhat higher level, and this is giving them a somewhat better operation for a time, say an average rate for the independents as a whole of about 40 per cent. of capacity, against about 32 per cent. in March and 30 per cent. in both February and January. Since prices were equalized the independents have booked very little fresh business, and they are hardly likely to just at present, considering particularly the fact now developed that in some commodities the extreme prices done were much lower than the prices commonly quoted. Before the readjustment, for instance, carload lots of black sheets were quoted at 3.75c and carload lots of galvanized at about 4.75c, but it is now admitted that sales were made at many dollars a ton below these figures. The buyers involved, therefore, will hardly be in haste to make additional purchases at the 4c and 5c prices now being quoted.

As to the Steel Corporation, it is booking very little absolutely new business, and does not expect to do so. Its business must come in the form of releases against orders previously suspended, and in specifications against old contracts, the Corporation having reported 6,284,765 tons of unfilled obligations as being on the books March 31. Thus far not much increase in releases and specifications is reported, but some is to be expected. The Corporation operated at 40 per cent. of capacity or a shade less in the past two weeks, and it is quite possible may get up to a 50 per cent. operation within the next two or three weeks.

### Pig Iron and Coke

Bessemer, foundry and malleable iron remain quotable at $25, valley, there being no new developments. Last reported transactions in basic iron were at $23, valley. Lately several producers, particularly steel works, that had been quoting $23 have gone up to $25, but there appears still to be some $23 iron offered. Demand is very light. The rumor that the Sharon Steel Hoop Co. has just bought 5,000 tons of basic at $22.50, valley, is wholly without foundation. The company did not buy and was not even in the market. The United Alloy Steel Co. has had an inquiry out for 10,000 tons but is hardly expected to buy any tonnage.

# BELIEVES PRESENT MARKET IS ABOUT AS LOW AS COSTS PERMIT

IN a recent issue of Iron Age, H. H. Pleasance, of the United Alloy Steel Corporation, has an interesting letter dealing with practices in the steel market, and making some rather pointed comments on market tendencies. The letter follows:

So much has been said and written on the subject of the immediate future of the steel business that consumers have been awaiting the recently announced price schedule with unusual interest. Their future business depends fully as much upon the stability of the steel market as does the steel business itself.

If the consumer could only realize that the last schedule published really brought prices down to the lowest possible level and a safe one for the rest of the year little attention would be paid to current pessimistic rumors preparing for a big midsummer slump. The industry as a whole has adjusted itself as far as it can, at least until the present surplus of steel scattered all over the country is used up. How can we possibly expect normal business unless there is an immediate realization of the present schedule as equitable for the year 1921?

Just as soon as a sale is made that is below the present schedule everybody jumps to the conclusion the market has gone to the dogs. You who undertake to keep the country posted on market prices jump at the chance to tell the public that the price has already been shaded. The real facts are never brought out. Very frequently sales are made of material that has been held in stock for a long time. The analysis may be somewhat out of line and the producer offers it at a figure merely to liquidate his inventory. At that moment this new price is published, and the consumer becoming fearful of the shadow, crawls into his hole until winter is over. He persists in assuring us he too can buy at prices of his own making.

This process cannot be eliminated but it can be reduced. We all realize this is a buyer's market, but is the buyer growing fat on his price reduction propaganda? We claim not. He will realize it, too. But will he wait until we are in the midst of the worst slump we have yet seen—probably—unless we unite to stop it? During the war every industry pledged loyalty to our Government and gave it 100 per cent. Why not encourage industry by pledging that we will continue the present schedule for the remainder of the year and dispense with current reports which tend to disturb business and postpone more indefinitely the date of normal production, full dinner pails and a prosperous United States of America?

H. H. Pleasance.

# JAPAN WANTS THE SMALL POWER MOTOR

**Department of Trade Wants Canadian Firms to Make a Bid For This Business**

Yokohama.—Some months ago an inquiry was published in the Weekly Bulletin for small electric motors of ¼ and ⅛ h.p. for the Japanese market, but apparently no interest was shown owing to the fact that at that time Canadian manufacturers were fully occupied with domestic business. From the same source have again come inquiries for these motors, and Canadian manufacturers of electrical goods should not lose this opportunity of placing their products on the Japanese market. These electric motors are used for very many purposes in Japan. Electricity is procurable practically in any part of the country, and as a result the small household manufacturer, who makes some small article in his own home with the help of his family, will have a small electric motor to turn his machine. The silk filatures and spinning mills use hundreds of these motors. In fact, its use is almost unlimited at the present time.

The British concern in Kobe which is making inquiry for these motors is importing them from St. Louis in the United States. The ¼-h.p. model costs approximately 65 yen landed in Japan, while the ⅛-h.p. costs about 40 yen landed. This will give Canadian manufacturers some idea of the competition they must meet, but it is earnestly requested that Canadian manufacturers will make a bid for this business.

Further information and the address of the firm requiring these motors may be had on application to the Department of Trade and Commerce, quoting file No. T.C.-2-110.

## Pig Iron Market

Pittsburgh reports the new price named by both the independent steel companies and the Carnegie Steel Co. has not served to attract buyers. It is understood, however, to have brought some specifications to the Carnegie Steel Co. on old orders. Makers of refined iron bars report no improvement and most plants are idle. One stack which has been banked for several weeks will be going into blast May 1.

Current business is confined to carloads and the lowest producer's price quoted is $24 local furnace for No. 2 foundry on the Chicago market.

Sales on the New York market during the past week amounted to 9,000 to 10,000 tons placed by cast-iron pipe and other buyers. Prices show a wide range. The lowest are considered to be $24 furnace on No. 2 foundry, $25 on No. 2X and $26 on No. 1 foundry, but in some cases several dollars higher have been paid.

The United Alloy Steel Corporation, Canton, are inquiring for 10,000 tons of basic iron for May delivery, but has not yet definitely decided whether it will buy this iron or blow in its furnace.

The Boston pig iron market is practically at a standstill, with but few sales and no new specific inquiries developing.

The establishment of a market is impossible, and quotations are not available that would bear any relation to an actual transaction, owing to a complete absence of any demand at St. Louis.

At Birmingham the middle of the month found the $25 base for Birmingham iron remaining only for car lots.

With the exception of a Columbus, Ohio, melter, who is in the market for 1,000 tons of basic and 100 tons of low phosphorus, delivery to extend over the next five months, inquiry is limited to one and two carload lots in the Cincinnati district.

On the Philadelphia market there has been a slightly increasing demand during the past week. A number of sales ranging from a carload to a few hundred tons have been made.

## Scrap Metal

There has been practically no change in general conditions on the Pittsburgh market, except that between the fact that producers are not pressing much material for sale and expectations of a fuller operation of steel plants as a result of the price stabilization, the market has a somewhat steadier undertone.

The market at Chicago has taken a firmer tone, as dealers are looking forward to better trade. Several hundred tons of heavy melting steel were bought at from $11.25 to $11.50 per gross ton.

Several railroads have withdrawn their lists in the New York district, owing to the lowness of the prices bid for scrap. There is a scarcity of No. 1 machinery cast, steel car axles, shafting, stove plate and pipe, though the other grades have accumulated freely because of the few sales to plants.

Cleveland reports a little better feeling in the scrap market, which is attributed to the establishment of new prices by the Steel Corporation. There were very few transactions during the week.

Prices on borings, turnings, locomotive tires and car wheels are 50c lower, and iron axles have been bought at $3 below previous quotations on the Cincinnati market.

# The Week's Events in Montreal Industry

The successful contestant this year for the gold-headed cane annually presented by the Montreal Harbor Commissioners to the captain of an ocean liner first bringing his ship to the port goes to Captain Michael Doyle, of the Cunard freighter Venusia, which arrived last Thursday night from London.

* * *

At the organization meeting of the Corporation of Professional Engineers of Quebec, held at the headquarters of the Engineering Institute of Canada, A. R. Decary was elected president. Adhemar Mailhiot has been re-engaged as registrar and offices have been opened in the Dandurand Building, where all communications will be addressed. The object of the new organization is to bring together engineers from all parts of the Dominion and assist in the ethics of the profession. It is also the intention to so organize the profession through the Dominion that in time a Dominion registration may be provided, thus enabling engineers to practise in any province.

* * *

At a meeting held last Thursday under the auspices of the Canadian Workers' Federation of Returned Soldiers and Sailors, the Hon. C. C. Ballantyne was the speaker of the evening, during the course of which he was presented with a gold membership badge of the Federation. During the course of his remarks Mr. Ballantyne stated that tenders would soon be asked by the Government for the construction of an ice breaker, and expressed the hope that the workers present would co-operate with the shipyards here so that they would be in a position to quote with some prospect of securing the contract for a Montreal firm.

* * *

At the last meeting of the Montreal section of the Engineering Institute of Canada, an address was given by G. E. Newill, the general manager of the Robb Engineering Works, of Amherst, N.S., on the development of turbine construction, and in particular, on the achievement of the Dominion Bridge Co., of Lachine, in building a turbine power installation for the British-American Nickel Co. at Sudbury. It will be interesting to know that this is the first time that an engineering firm in Canada has accepted the challenge to construct a large power turbine of this character, running as it did in about a quarter of a million dollars and requiring all the precision of mechanical discernment and nicety that might be needed in the making of a full jeweled watch to be propelled by steam.

## STEEL OF CANADA BOARD RE-ELECTED

Hamilton.—At the eleventh annual meeting of the Steel Company of Canada, it was reported that the company had made profits of $3,924,041.50 during the year, which was considered very satisfactory. This amount remained after deduction was made for repairs, maintenance, improvements and provisions made for inventory reserve and income tax payments.

The following officers were elected:

Directors—Cyrus A. Birge, A. J. Brown, J. H. Duggan, Lloyd Harris, Robert Hobson, Ross H. McMaster, Hon. John Milne, F. G. Osler, Sir Thomas White, K.C.M.G.; Hon. Smeaton White, Charles S. Wilcox.

Executive officers: Charles S. Wilcox, chairman of the board; Robert Hobson, president; Ross H. McMaster, vice-president; H. H. Champ, secretary and treasurer; H. S. Alexander, assistant treasurer; Corbett F. Whitton, assistant secretary.

# INDUSTRIAL NEWS

## NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

## MONTHS YET BEFORE LOW STEEL PRICES WILL BE OF ASSISTANCE

ALTHOUGH a new schedule has been announced in steel prices, it will be some months yet before a number of the large users can take advantage of the new prices.

The agricultural implement makers, for instance, make their purchases months in advance. It is necessary to do this in order that they may be sure of supplies coming along regularly in conformity with their manufacturing schedule.

Speaking of these conditions, J. N. Shenstone, of the Massey-Harris Co., said, "It will probably be well on in 1922 before we shall be able to take advantage of cheaper steel. It is impossible for a lower price to have an immediate effect on our business. Right now the sheds and warehouses around here are full of machines that have been made at a high price, and we have a lot of material that has yet to be worked up. In this way it will be some months yet before the lower priced material starts to make its way into our shops."

Mr. Gifford, works manager of the Toronto plant, left at the first of the week for South Africa, where a shipment of machinery has been sent.

The Russian situation is being watched with interest from the London office of the firm. A number of different proposals have been put forward to sell machinery to Russia, some of them carrying with them proposals to pay for the same in oil and leather. There is nothing yet to indicate that the Russian people are in any state to trade with on a safe and profitable basis, and the Massey-Harris Co. have made no move to re-open their business in that country.

## WANT BUSINESS FROM THESE FIRMS

**People Abroad Who Want to Sell Goods if Canadians Can Supply Them**

Firms wishing to secure information about any of the following should apply to this paper, mentioning the number in each case:

2921. **Engineering and structural materials.**—A responsible Canadian firm of contractors and consulting engineers established in London who are interested in public works contracts in certain British colonies invite Canadian manufacturers of engineering and structural materials wishing to obtain export business to submit to them full particulars to practise in any province.

2925. **Electrical material.**—A Milanese house wishes to buy electrical material in Canada.

2934. **Electrical supplies.**—A dealer at Zagreb, Yugoslavia, would be glad to hear from Canadian exporters of textile and other lines suitable for the Yugoslav market.

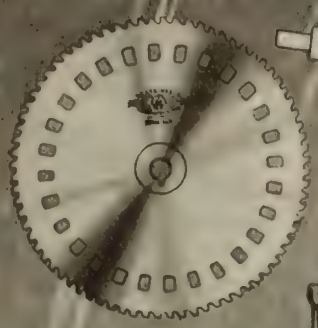
2937. **Hardware and metals.**—A firm in Belgrade, Yugoslavia, would be interested to receive particulars from Canadian exporters of hardware, iron and steel and other metal lines and agricultural implements.

**Goodyear Changes.**—Control and management of the Goodyear Tire & Rubber Co. will pass from F. A. Seiberling, now president and general manager, to an investment bankers' committee as the result of plans for refinancing definitely announced. The committee representing the bankers will control the management of the company for a maximum period of twenty years, this being the maturity of an issue of $30,000,000 Goodyear first mortgage twenty-year 8 per cent. sinking fund gold bonds which will be offered for public subscription.

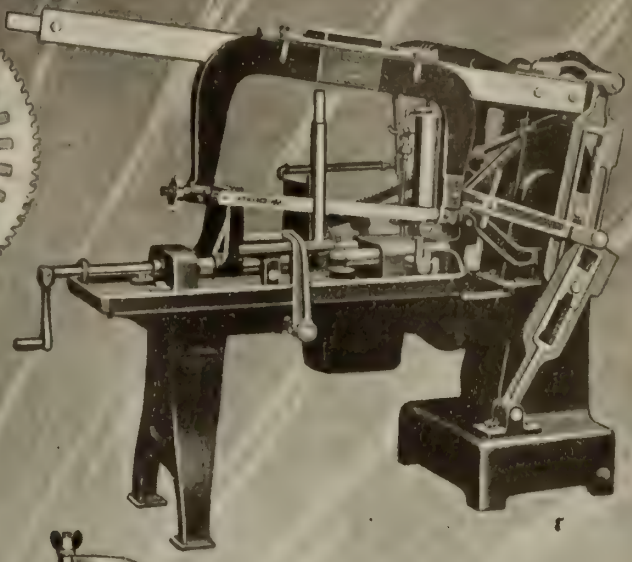
**Conditions Better.**—There are signs of a revival of business among the factories of St. Catharines. Some of them, notably McKinnon's, are taking on new men daily, and have several hundred men at work. The big plant was practically shut down this winter, but has now a rush of orders, and may have to put on a double shift for a time. The Consolidated Rubber Co. has lately spent a large amount of money on its engine house at Port Dalhousie, which seems to indicate that the present shutdown will not be for very long.

**Formed New Connection.**—D. J. Beatty, formerly advertising manager for the Northern Electric Co., has resigned to go into partnership with G. L. MacGillivray in the G. L. MacGillivray & Co., Ltd., 103 Notre Dame Street West, Montreal. This company was recently formed to look after the selling interests of the following firms in Eastern Canada: Edwards & Co., Inc., American Insulator Corporation, Waterbury Manufacturing Co., Chase Metal Works, Parker Supply Co., Inc., R. M. Radio Co. of London, Eng., the Prometheus Electric Co. For some time prior to enlisting for overseas service, Mr. Gordon MacGillivray was assistant supply sales manager for the Northern Electric Co. at Montreal.

**Engineer for Sarnia.**—It is likely that the selection of a city engineer for Sarnia will be made shortly. It is understood that from among forty applicants, who represent the entire Dominion from Halifax to Vancouver, the choice has narrowed down to two, who will be brought there for personal interviews with the council.



**Change in Name.**—In connection with the formation of the Hamilton Car Co., Ltd., the following announcement is made: The National Steel Car Corporation, Ltd., of Hamilton, Ont., took over the plants and effects of the National Steel Car Co., Ltd., as a going concern, and is now operating the business under the title of the National Steel Car Corporation, Ltd. To prevent confusion on account of the similarity of names, the National Steel Car Co., Ltd., has changed its corporate name to that of the Hamilton Car Co., Ltd. The Hamilton Car Co., Ltd., owns certain stock and effects pending final liquidation, but is not in the business of building railway car equipment.



**Important Steps.**—According to reports to the Canada Research Council from the Associate Committee of Mining and Metallurgy it is now regarded as highly probable that the vast deposits of low-grade magnetic iron ore can be successfully smelted in Canada on a commercial scale. The Lignite Utilization Board reported that it has now every reason to believe that in the near future it will be successful in producing on a commercial scale from the low-grade lignites of Western Canada briquettes equal and in some respects superior to anthracite coal.

C. Rehden & Son, Bowmanville, are preparing plans for foundry to cost $60,000.

## Scrap Yard To Be The First to Reflect Turn of the Market

An improvement in the market conditions, or in business generally, must be preceded by an improvement in the scrap metal trade. That is the statement of one of the best informed men in the business.

"It has been so in many past experiences and it will be true again in the present case. Iron and steel will show no improvement until there is a betterment in the scrap of these lines and the same can be said of copper. There will be no movement in goods that copper goes into—and they are numerous—until there is a stiffening of prices in the scrap market.

"It is true," our informant concluded, "that coming events cast their shadows before, and in this case the shadows must first fall on the scrap yards. Watch and see."

## BIG INCREASE IN POWER COSTS

### How These Charges Have Been Increased During the Last Few Years

Cost of power occupied the time of Paul M. Lincoln, the noted American electrical engineer, in his address to the Electrical Engineering Institute at the Physics Building of the University of Toronto.

Mr. Lincoln dealt largely with fixed charges and operation ratio of electrical plants throughout North America. He showed that the price of every raw material had increased tremendously since before the war, and that this made an enormous difference in the price of operation of electrical plants then and now.

### A Steady Increase

The actual operation cost dropped from 1910 to 1914, the average drop running about 5 per cent., but since 1915 there has been a rapid and steady increase in power house costs.

Mr. Lincoln estimated that the cost of a power plant to-day would run to 225 per cent. more than it did in pre-war times. This means that the public must pay, in the same ratio, these increased charges.

In plants which are operated by coal power, Mr. Lincoln showed that the coal costs during the past few years had considerably enhanced the cost of power. Further, he stated that the cost of labor in operation of power plants might be taken at 85 per cent. in excess of what it was in 1914. In total, he fixed the ratio of expenses in power operation from 1914 to 1920 as approximately 2½ to 1.

### A Slight Mistake

"Oh," exclaimed the fair boarder, as a couple of calves scampered across the meadow, "what pretty little caflets!"

"Yew air mistaken, ma'am," said the old farmer. "Them's bullets."

### MECHANICAL YEAR BOOK

The 1921 edition of the Mechanical World Year Book, published by Emmott & Co., Ltd., 65 King St., Manchester, England, is well worth a place in any bookcase, desk or toolbox. To go over the details in brief space is impossible, but here are a few of the subjects covered: Steam and steam engine, constructional details of same, notes on condensing plant, notes on steam turbines, steam boilers, boiler construction, riveted joints, safety valves, boiler mounting and setting, boiler chimneys, notes on superheating, gas engines, oil engines, Diesel engines, suction gas producers, properties of metals and alloys, structural iron and steel work, beams and girders, strength of materials, shafting, keyways, and gearing.

Following this are the subjects of gear cutting, milling machine practice, notes on grinding, limit gauges, standards of limits, verniers and micrometers, Morse taper shanks, ball and roller bearings, notes on belting, rope driving, chain gearing, friction and lubrication, water and hydraulic work, hydraulic data, steam heating, notes on screw cutting and miscellaneous tables of considerable use to mechanics in general. The English price of this book is 2s. 6d., and the Canadian price, including postage, would be between 75 cents and a dollar.

The Joseph Stokes Rubber Co., Welland, Ont., whose plant was built last fall, have completed the installation of machinery and intend to start on quantity production within a few days.

### Dissipated Wretch!

A small, hen-pecked, worried-looking man was about to take an examination for life insurance.

"You don't dissipate, do you?" asked the physician, as he made ready for the tests. "Not a fast liver or anything of that sort?"

The little man hesitated a moment, looked a bit frightened, then replied in a small piping voice: "I sometimes chew a little gum."

### TRADE GOSSIP

The Gove Motor Car Co., Detroit, Mich., contemplates the construction of a factory.

The erection of a three-story garage is planned by Patrick Labell, 721 Dorchester Street, Montreal.

An addition will be erected to the cement plant of the Middleton Cement Products Co., Middleton, N.S.

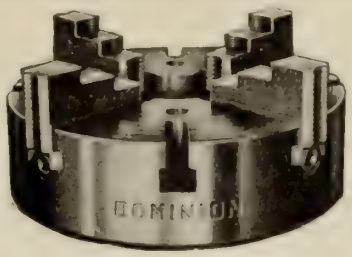
An addition will be erected to garage at cost of $15,000 by J. Van Sickler, 374 Dupont Street, Toronto, Ont.

The Glem Motors, Ltd., has been incorporated with head office at Toronto and capital stock of $1,000,000.

Smart's Brockville Furnaces, Ltd., is capitalized with capital stock of $100,000 and head office at Brockville, Ont.

The Abrams West Columbia Oil Co., Ltd., has been incorporated with capital of $1,000,000 and head office at Toronto.

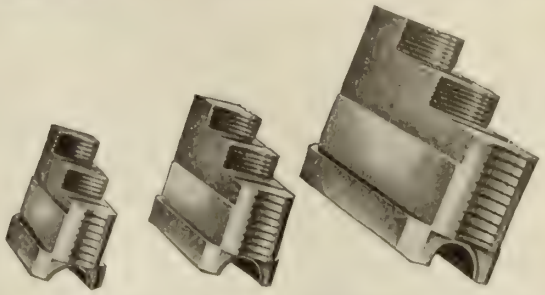
The Canada Iron Foundries, Fort William, are contemplating the erection of addition to foundry at a cost of $150,000.



The West Gas Improvement Co., Manchester, England, has been awarded the contract for the construction of carbonizing plant costing $125,000 for the Victoria Gas Co., Victoria, B.C.

Permit has been granted to the British Canadian Oil Co. for the erection of a motor service station at the southeast corner of Bloor and Shaw Streets, Toronto.

**Nearing Completion.**—The Carbon and Alloy Steel Co., who are installing an electrical steel mill at Fraser, Ont., near Niagara Falls, have progressed with their plant to a point where the electrical equipment is now being placed in position. The mill, which will specialize in carbon and tool steels, should be in operation within the next six weeks.



**New Plant Starts.**—The electric steel foundry of the J. W. Cumming Mfg. Co., New Glasgow, N.S., is now in operation, under the direction of J. M. Robertson, Montreal, the designing engineer of the plant, and C. A. Pascoe, metallurgist, and Sanford Davis, electrical engineer, of Montreal.

**Purchasing Agents to Meet.**—The second annual convention of the Purchasing Agents' Association of Canada will be held in Toronto on May 14th at the King Edward Hotel. Every purchasing agent, whether a member or not of any of the associations now formed, is cordially invited to attend. Matters vital to every industrial company and purchasing agent will be discussed.

# SAVING GAGES THAT WERE USED IN THE TURNING OUT OF WAR MUNITIONS

Working quietly in Washington since shortly after the armistice, John O. Johnson, head of the gage section of the War Department, has been engaged in the task of gathering together and storing away in places where they can be found when needed all the gages used in the manufacture of arms and ammunition in plants of all descriptions throughout the country. Until recently Mr. Johnson had the rank of major, but was honorably discharged. He continues, however, as head of the gage section, which was created after the war.

It is estimated that the value of the gages is approximately $30,000,000. The collection and preservation of these instruments is a step forward in carrying out a general policy which has for its object the maintenance by the War Department at all times of the necessary minor attachments, such as dies, jigs, special tools, etc., by which machinery used in commercial manufacture may be changed almost over night for making parts of arms and ammunition.

Since the gage section was created Mr. Johnson has been at work supervising the collection into the various Government arsenals of all gages and special tools which were used by private plants in the manufacture of arms and ammunition. Considerable progress has been made in this undertaking and in cataloging and filing of these instruments.

The policy of "manufacturing preparedness" is the result of the efforts of Representative John Q. Tilson of Connecticut, who has been urging the plan upon the War Department since 1913 and made frequent appeals for it as a member of the House Committee on Military Affairs before the United States entered the war. His efforts have been partly successful, as is indicated by the work being supervised by Mr. Johnson. It is expected that his plan will be put into complete operation. It already has been submitted to President Harding, and Representative Tilson will confer with Secretary of War Weeks soon with reference to the program.

Mr. Johnson, who comes from New Haven, Conn., formerly was associated with the Winchester Repeating Arms Co. Shortly after the outbreak of the European War, he was employed by the Imperial Munitions Board of Canada to supervise the placing of contracts in the United States for the manufacture of gages for the Canadian government. Being an expert on gage manufacture, he was invited, upon the entrance of the United States in the war, by the ordnance bureau of the War Department, to accept a commission in that corps. He gave up his work with the Canadian government and accepted a commission as captain of ordnance of the United States Army, being promoted subsequently to the rank of major.

In an article recently contributed to the Army Ordnance Journal, Mr. Johnson says that he expects to complete the work of conserving the gages by June 21. The net result will be that the Ordnance Department, through the gage section, will be able to tell at any time just what gages are on hand, the condition of each gage and its exact location. "In case of emergency, where quick expansion would be imperative, complete sets of gages on each component could be selected and distributed so that every contractor would receive his immediate needs, which would hold him over until more gages could be made. By this method the contractor would be ready to begin work as soon as his machines and equipment were arranged, and would save considerable time in getting into quantity production."

# HAVE CUT PRICE OF IMPLEMENTS

**How Old Country Iron and Steel Trade Is Trying To Get Buyers To Take Hold**

Manchester.—In an endeavor to stimulate demand, and in a measure to meet competition emanating from certain foreign countries, reductions in many lines of iron and steel manufactures have recently taken place. Northampton forge is now selling at £8 at the furnaces, and foundry iron at £8 15s. per ton. Staffordshire unmarked bars have fallen £2 per ton, the present selling price being £24 10s. The Lancashire price is £22 per ton.

Owing to keen competition from Belgium, nut and bolt iron has fallen to £22 per ton. Gas strip records a reduction of £1 per ton, the price now being £26.

A fall of £3 per ton on steel strips and hoops has brought the ruling price to £20. Steel prices are steadily falling. Belgian billets are offered in the midland counties of England at £9 per ton.

A further decline in the values of black and galvanized sheets took place last week, which left the prices at £20 and £24 10s. per ton respectively.

In the Cleveland iron district the general slump in trade has been keenly felt, with the result that the ironmasters have decided to cut prices. Further, the influx of Belgian (and probably German) pig-iron, which is considerably cheaper than the Cleveland product, has had a deterrent effect on the sales of the latter district. A fall of 75s. per ton since the end of last year is recorded in connection with Cleveland pig-iron. No. 1 is now £7 15s.; No. 3 G.M.B., £7 10s.; No. 4 foundry, £7 9s.; No. 4 forge, £7 7s. 6d.; mottled, £7 7s. 6d.; and white iron, £7 5s. —all for domestic consumption. For export an additional 5s. per ton is added. Belgian pig-iron is said to be offered at £7 per ton delivered.

The drop in hematite values has brought No. 1 down to £9 2s. 6d., and mixed numbers down to £9 per ton.

# GERMANS CAN SELL TOOLS CHEAPER THAN THE BRITISH CAN MAKE THEM

The Department of Overseas Trade, through the Toronto office, sends the following information exclusively to Canadian Machinery:

At the annual meeting of the Machine Tool Trades Association a proposition was put to the meeting that the members should refrain from dealing in German machinery. This resolution was defeated by a large majority, a fact which has caused a good deal of comment, and a certain amount of misunderstanding. The following statement may serve to make the position clear.

In the first place it was seen that the resolution would be ineffective in securing the desired object. There are firms outside the association who would, it was felt, immediately take advantage of such an action to obtain trading agreements with German firms, and it would thus result that firms factoring United Kingdom machine tools would not be able to do the full amount of business in British goods otherwise possible, since buyers naturally prefer to give their business to firms offering the widest range of goods. Secondly, some firms are avowed opponents of protective measures, whether by state action or by resolution, and these opposed the measure on general grounds. The latter is not, however, a general attitude. At present most firms cannot meet the position created by the rate of exchange, by which German goods can be sold at a price less than the cost of the materials in the United Kingdom, and many feel that if the exchange position were rectified the United Kingdom manufacturer would, by efficient production, defy competition. These firms are in favor of some measure of protection which would remove the disadvantage caused by the low rate of exchange, at any rate for the home market.

It may be of interest to observe in connection with this and other industries, that a measure is being introduced into parliament intended to deal with the situation in the home market caused by the low rate of exchange of continental currencies.

1—20″ Sibley, B.G., W. L. & P. Feed, Auto. Stop (used).
1—3-Spindle Silver Gang Drill, 20″, Tapping Attachment (used).
4—4-Spindle W. & R. Sensitive, Cap. ½″ (used).
1—36″ C.M.C., Heavy Duty (used).
1—36″ Bertram, Heavy Duty (used).
3—National Acme Horizontal Drills (½″ Cap.) (used).

### BORING MACHINES

1—66″ Bement-Niles Vertical, 2 Heads, 24″ Under Rail (used).
1—Universal, No. 2½, Horizontal, Table 42″ x 22″ (used).
1—Bullard, "New Era," Vertical Turret, 36″, Complete Equipment (new).

### POWER HACK SAWS

1—No. 10 Racine, 8″ x 8″ Cap. (new).
1—No. 7 Watkins, 9″ Cap. (used).
1—No. 1 Racine, 6″ x 6″ (used).
1—Peerless, 6″ x 6″ (used).

### AIR COMPRESSORS

1—8″ x 8″ Sullivan, Class WG-3, Belt Driven (used).
1—8″ x 10″ x 8″ Bury, Steam Driven (used).
1—12″ x 18″ Ingersoll-Sargent, Belt Driven (used).
1—12″ x 12″ Can. Ingersoll-Rand, Belt Driven (used).
1—3″ x 1½″ x 3″ American, Motor Driven (used).

### GRINDING MACHINES

1—Landis No. 4 Universal (used).
1—Landis, Plain, Self-contained, 36″ x 12″ (used).
1—Landis, Plain, 42″ x 12″ (used).
1—Fitchburg Cylindrical, 8″ x 36″ (new).
1—Globe Universal Tool and Cutter Grinder (new).
1—Le Blond Universal Tool and Cutter Grinder (used).
1—Cincinnati Universal Tool and Cutter Grinder (used).
1—Gardner No. 12, Double Disc, 18″ Discs, with End Grinding Attachment (used).
1—Diamond Surface Grinder, Table 84″ x 30″, Cup Wheel 24″ Dia. (used).
1—Lafayette Universal Grinder.
Several Pedestal Emery Stands.

### PUNCHES, SHEARS AND PRESSES

1—Lennox Rotary Bevel Shear (1″ Cap.) (new).
1—Crowell Hydraulic Rocking Press, with Pump (used).
1—Greenerd No. 3½ Arbor Press, with Stand (used).
1—Greenerd No. 3½ Arbor Press, without Stand (new).
1—Ryerson Single End Punch (½″ Cap.) (new).
3—Ryerson Single End Punches (¼″ Cap.) (new).
1—No. 19 Inclinable Power Press (new).
1—Newell Foot Power Press.
1—68N Bliss Double Action (used).
1—No. 57½ Toledo (used).

### MISCELLANEOUS

2—No. 4 John Hall Pipe Machines (new and used).
1—High Speed Riveting Hammer, No. 3 "A" (used).
1—Beaudry "Champion" Power Hammer, No. 9 (used).
1—Grant Rivet Spinning Machine, Pedestal Type, No. 80A, 3-16″ Cap. (new).
1—Grant Rivet Spinning Machine, Bench Type, No. 80B, 3-16″ Cap. (used).
1—Leader Polishing Lathe, Motor Driven, Direct Current, 5 H.P., 115 Volt, 2,800 R.P.M. (used).

#### Steam Hammers

1—Sellers Steam Hammer, 400 lbs.
1—Brandts Power Hammer, No. 12, 500 lbs.
1—Fairbanks Power Hammer, 250 lbs.
1—Brandts Belt Drive, 3″ x 20″

#### Planers

1—Herrington, single head, Table 42″ x 8′.

#### Hack Saws

2—Racine, drawcut, capacity 11″
14—Racine, drawcut, capacity 5″.
2—Victor, drawcut, capacity 8″.

#### Gear Hobber

1—New, Barnes, No. 1 Gear Hobber.

### AIR COMPRESSORS

#### Belt Driven

2—Canadian Ingersoll-Rand, Cross compound, 16″ and 9″ x 16″, 780 cu. ft. at 100 lbs.
1—Canadian Ingersoll-Rand, two stage, 14″ and 9″ x 12″, 400 cu. ft. at 100 lbs.
1—Bury, 12″ x 12″, 340 cu. ft. at 100 lbs.
1—Bury, 10″ x 10″, 150 cu. ft. at 100 lbs.
1—Sullivan, 12″ x 12″, 345 cu. ft. at 100 lbs.

#### Steam Driven

1—Ingersoll-Rand, Corliss Type, cross compound, 2 stage, cylinders 20″, 36″, 30″ x 36″ stroke, 1,920 cu. ft. at 100 lbs.
1—Ingersoll Sargent, cross compound, 2 stage, 14″ and 22″ x 18″, 900 cu. ft. at 100 lbs.
1—Canadian Rand, straight line, 12″ and 12″ x 18″, 280 cu. ft. at 100 lbs.
1—Ingersoll-Rand, two-stage, 15″ and 25″ x 24″, 1,600 cu. ft. at 100 lbs., direct connected to 25 cycle Westinghouse Motor.
1—Canadian Rand, two-stage, cross compound, 12″ and 20″ x 18″, 18″ and 12″ x 18″, 775 cu. ft. at 100 lbs.

### PUMPS

1—No. 7 Cameron Sinking Pump.
3—No. 2 Cameron Removable Bushing Pattern Pumps.
1—Cameron Prospectors' Sinking Pump.
1—Swaby two-stage Centrifugal Pump, 3″ suction, 2½″ discharge, direct connected to 15 H.P. Motor.
1—Swaby two-stage Centrifugal Pump, 1½″ suction, 1½″ discharge, direct connected to 5 H.P. Motor.
1—Cameron, No. 2, four-stage Centrifugal, direct connected to 30 H.P. Motor, complete with auto float starter.
1—Worthington Boiler Feed Pump, 14″ x 8½″ x 12″.
2—Duplex Boiler Feed Pumps, 3″ x 2″ x 3″.
2—Edwards Triplex Pumps, 6″ x 8″.
2—Myers Geared Pumps, 2½″ suction, 2½″ discharge.
3—Fairbanks Oil Pumps, 4½″ x 3″ x 4″.
1—Pulsometer Pump, No. 2, 1½″ x 1½″.
1—Birdsboro Centrifugal Sand Pump, 24″, complete with base and sub-base for direct connection to Motor.

**WILSON-McGOVERN, Limited, Lumsden Building, Adelaide St. E.**
**TORONTO, ONTARIO**

**KIM-O** *The Boiler Compound That Has No Equal.*

**Oils, Soaps, Greases, Roofing Paint, Machinery.**

1—Belliss & Morcom Engine, 750 H.P.
1—Belliss & Morcom Engine, 135 H.P.
2—Wheelock Engines. Each 75 H.P. One with Heater and Pump attached.
1—30 x 6 Upright Boiler, complete.
1—42 x 7 Upright Boiler, complete.
Numerous other Boilers and Engines on hand.

**Write us your requirements. We can satisfy you. Boilers sold subject to inspection only.**

**THE BOILER & ENGINEERING EQUIPMENT CO., REG.**
**Office: 222 CRAIG ST. W., MONTREAL, P.Q.**

# Our Loss--Your Gain

Here are a few opportunities for you to save some money:

2—26 x 12 first-class used C.M.C. Lathes, $650 each.

2—No. 0 B. & S. used Automatics, $650 each.

2—No. 2 B. & S. used Automatics, $750 each.

These are a few. Write us about other new and used machines we are offering at reduced prices, such as Gap Lathes, Turret Lathes, Shapers, etc.

**Williams & Wilson, Limited**
**84 Inspector Street**
**MONTREAL**

## The Kaitting List Of Second-Hand Machinery

Two turret lathes, Warner & Swasey make.
One engine lathe, 21" x 12', McGregor-Gourlay make.
One Corton Disc Grinder, 20", with press.
One 30" band saw, manufactured by the Preston Machine Co.
One London engine lathe, 20" x 10'.
One three horsepower electric motor, Westinghouse.

**Geo. C. Kaitting & Son**
**54 & 56 Ainslie St. S.**
**Galt, Ontario**

## PUNCHES AND SHEARS

S. 22B 1—6″ throat, Hilles & Jones No. 1 Horizontal Punch.
S. 38B 1—Size T40, Henry Pels & Co., John's Patent Shears.
W. 5B 1—30″ Jumbo Punch, cam shaft drive off pulley shaft, 7 8″ hole and 7 16″ plate. Die block, slipper, belt drive.
W. 13B 1—56″ throat, American Ship Vertical Punch; capacity 1″ through 1″ ; belt drive, with T. & L. pulleys.
W. 40A 1—No. 5 60″ throat, Southwark Vertical Punch.
W. 6B 1—12″ throat, Hilles & Jones Bar Shear.
W. 49A 1—48″ throat, Southwark Plate Shear.
W. 31A 1—48″ throat, quick work Rotary Shear.
W. 17B 1—14″ throat, Coping Shear.
D. 87A 1—No. 252 Niagara Squaring Shear.
D 46B 1—No. 352 Niagara Squaring Shear; cuts and squares 14 gauge mild steel; has 16″ throat for trimming and splitting; T. & L. pulleys, 4½″ belt, cam and lever hold down.
D. 48B 1—**Foot Squaring Shear; 22″ knife; capacity to cut 24 gauge mild steel. Light machine.**
D. 43B 1—**2A 30″ throat, quick work Rotary Shear,** 4 speed changes; cuts curves of any radius and will cut minimum round hole 5½″ diameter. Capacity up to 5/32″ mild steel. Belt drive.
CL 4B 1—30″ gap, Globe Iron Works Double End Punch; one end 1″ hole and ½″ plate; other end 1″ hole and ¾″ plate. Belt drive.
CL 16B 1—36″ throat, American Ship Single Vertical Punch; belt drive; capacity 1″ through 1″.
B 9A 1—12″ throat, Southwark Horizontal Punch.
B 7A 2—84″ throat, Long & Alstetter Plate Punches.
B 27B 1—Size T-40 Henry Pels & Co., John's Patent Shears.
B 28B 1—42″ throat, Plate Shear; capacity to shear 1″ plate.
B 6A 1—84″ throat, Long & Alstetter No. 2 Single Plate Shears.
B 8A 1—No. 4B Quick Work Rotary Shear.
L 13B 1—36″ throat, Cleveland Ship Building Co..
L 21B 1—36″ throat, Cleveland Ship foot operated Single Punch.
L 14B 1—32″ throat, Cleveland Punch and Shear Manhole Punch.
L 24B 1—18″ throat, Channel Shear.

## Polishing Machines

D 57A, D 58A, D 81A 3—No. 5 Webster and Perks Double Spindle Polishing Machine.

## Drills

Ch. 25A 1—25″ Barnes upright Drill Press.
Ch. 32A 1—26″ Barnes back geared upright Drill.
Ch. 45A 1—30″ Putnam upright Drill.
L 2A 1—Aurora Upright Drill.
L 10A 1—48″ Morris Plain Radial Drill.
L 26A 1—48″ Reed Prentice Plain Radial Drill.
L 39A 1—6′ American Plain Radial Drill.
L 15B 1—16′ arm, Post Radial Drill, made by Cleveland Punch and Shear Works.
D 30A 1—Radial Reed Prentice 6′ Standard.
D 20A 1—5′ Arm Radial Drill, Niles-Bement-Pond semi-universal.
D 57B 1—12″ Burnham Sensitive Drill.
D 15B 1—20″ Barnes Upright Drill.
D 32B 1—Foote-Burt, 4 spindle, No. 2 Mud Ring and Flue Sheet Drill.
Ch. 33B 1—15′ arm, Post Radial with No. 3 Morse taper socket.
Ch. 29B 1—24″ Dallette Portable Radial Drill.

## Rolls

S 41B 1—Set Hilles & Jones Mangle Rolls, 6′ 10″ rolls, 8′ 2″ between housings, takes 7′ 6″ plate, hand adjustment.
D 54B 1—Set Forming Rolls, Peck, Stowe & Wilcox.
D 72B 1—Set 30″ Hand Power Forming Rolls.
B 53A 1—Set 16′ Hilles & Jones Bending Rolls, Pyramid Type, top roll 14″ diameter, bottom rolls 12″ diameter.

## Milling Machines

D 110A 1—Milling Machine, No. 3B Milwaukee Plain, Kearney and Trecker make.
D 116A 1—No. 3H LeBlond Heavy Duty Miller.
W 24B 1—No. 2 LeBlond Plain Miller.
D 40A 1—No. 5 Cincinnati Plain Milling Machine.
D 41A 1—No. 4C LeBlond Milling Machine.
D 80A 1—No. 5 Cincinnati Universal Milling Machine.
D 53A 1—24″ x 24″ x 12′ Ingersoll Milling Machine.
D 39A 1—No. 6 National Transit Plain Milling Machine.
D 84A 1 No. 2 Rockford Universal Milling Machine.
D 13B 1—No. 5 Brown & Sharpe Plain Milling Machine.

## Rivet and Bolt Headers

S. 29B 1½″ to 1¼″ Ajax Single Rivet Heading Machine.
S. 35A 1—Improved 1¼″ Ajax Steel Bed, continuous motion, hand feed Heading Machine.

## Riveters

S. 30B 1 Wm. Sellers Co., Upright Stationary Steam or Air Riveter.
CL. 25B 1—10″ gap, Morgan Horizontal Hydraulic Riveter.
Ch. 19A 1—Hanna 75″ gap Bull Riveter.

## Rivet Machine

B 46A 1 Acme A Rivet Machine.

## Rivet Forges

B 16A 2—Rivet Forges.

## Tables—Punch

W 41A 2—Lysolm Punch Tables, capacity 6 handle 25″ plate.

## BORING MILL

S 12A 1—7′x10′ Betts Vertical Boring Mill.
B 23A 1—48″ Niles Vertical Boring Mill.
Ch 1B 1—36″ Sellers Horizontal Boring Mill.
CL 25A 1—24″x24″x24″ Giddings and Lewis No. 0 Horizontal Boring Mill.
CL 36A 1—48″ Gisholt Vertical.
CL 29A 1—Sellers 84″ Vertical.
**D63A 1—60″ Derrick and Harvey Horizontal Boring, Drilling and Milling Machine.**
**D66A 1—60″ Gisholt Horizontal Boring Mill.**

## RIVET HEADERS

W 12A 1—National Rivet Header, Capacity up to 1¼″ diameter by 9″ long rivets.
Ch 51A 1—Acme size A, All steel open die Rivet Making Machine.
Ch 23B 1—½″ to 1½″ x 5″ Ajax Rivet and Bolt Making Machine.

## GANTRY CRANES

W 9A 1—15-ton Link-Belt steam operated variable Radius Gantry Crane, 90′ steel boom.
Ch 37B 1—Brown-Hoist Gantry Crane, 120′ boom.
Ch 26B 1—Gantry Crane, 172′ Boom, 49′ rail centers. Hook travel 149′. Clear lift 50′ 10″. Will be sold complete with 314′ long trestle. 30′ 10″ high. Crane capacity ten tons at end of boom. Equipped with three 220V. D.C. Motors.
Ch 14A 1—15 ton Link-Belt, 8-wheel single drum, steam operated Gantry Crane, mounted on Gantry sub-structure 30′ high. 90′ steel boom, 20′ rail centers, 54″ x 6′ boiler for 125 lbs. pressure.
Ch 14A 1—14-ton Link-Belt 8-wheel single drum, steam operated Gantry Crane, mounted on Gantry sub-structure 34′ high. 90′ steel boom, 20′ rail centers, 54″ x 6′ boiler for 125 lbs. pressure.
S 39B 1—Electric Drive Steel Gantry Crane, with 170′ boom. 55′ lift. Capacity 5 tons, 80′ from center, 18′ span. Will be sold with runway 580′ long.
S 2A, S20A 2—15-ton Link-Belt, fill revolving, steam operated.

## OVERHEAD CRANES

W10A 1—7½-ton Toledo, three motor Travelling Crane, 72′ 5″ span, 30′ lift.
W 11A 4—7½ ton Toledo three motor Travelling Cranes, 87′ 5″ span, 30′ lift.
Ch 24B 1—10-ton P. & H. overhead Travelling Crane.

## CRANES

B 10A 4—3-ton Sprague Electric Monorail Cranes, 15′ lift. Remote controlled. With trailing operator's cage. Complete with one 35 KW Generator set; 3 phase, 25 cycle, 220 V, on AC end; 220 V, DC on Generator end.
B 11A 1—10-ton Lakeside Electric Gantry Crane and trackage. Single line equipment. 67′ span. 60′ lift. Equipped with four 3 phase, 25 cycle, 220 V Motors.
B 59A 1—Hand Operated Overhead Traveling Crane, with 14′ 9″ rail centers, capacity 3 tons.
L 32A 1—20-ton Champion Electric Travelling Crane with 5-ton auxiliary hoist.
L 25B 12—Pedrick and Ayer Jib Cranes, 17′ 10″ arms.

## WALL CRANES

**Ch 32B 9—17 6″ arm Wall Cranes, with 4 wheel carriages.**

## Tanks---Oil Storage

CL 52A 2—Oil Storage Tanks, 8′ x 36′, equipped with ¾″ steam coils, two 3″ drains, 3″ vent, and 3″ pump inlet, 5-16″ plate; 13,500 gals. cap. each.
CL. 53A 1—Oil Storage Tank, 8′x26′ 6″ long, equipped with ¾″ steam coils, two 3″ drains, 3″ vent and 3″ pump inlet, 5-16″ plate, 9,950 gallons capacity.

## Shaper

L. 19A 1—24″ Gould & Eberhardt Shaper.

## Slotters

L 21A 1—18″ Newton Vertical Slotter.
CL. 40A 1—18″ Newton Vertical 48″ diameter table.

## Tube Bender

L 33A 1—Wonder Boiler Tube Bender.

## Plunging Press

CL 26B 1—75 ton Morgan Engineering Co. Plunging Press.

## LATHES

L 36A 1—16″ x 7′ Le Blond double friction back geared screw cutting Lathe.
L 5B 1—24″ x 16′ 0″ Pond back geared Lathe.
L 4B 1—18″ x 4′ 10″ Dietz-Schumaker & Boyce back geared rack and screw feed Lathe.
L 13A 1—42″ x 30′ 0″ Elyria roughing Lathe.
L 3A 1—42″ x 30′ Elyria roughing Lathe.
L 3B 1—26″ x 14′ 0″ Pond back geared Engine Lathe.
CL 15A 1—14″ x 8′ Champion Screw Cutting.
CL 28A 1—24″ x 14′ Boyce and Emmes double back geared Engine Lathe.
CL 46A 1—42″ x 28′ Pittsburgh; heavy duty; triple geared; face plates; steady and compound rests; driven by 20 HP, 230 V, 400-1200 RPM, D C Westinghouse type SK Motor.
Ch 10A 1—16″ x 8′ South Bend back geared Engine Lathe.
Ch 6B 1—21″ x 8′ bed, Bradford Lathe; back geared.
Ch 5B 1—26″ x 12′ Dietz-Schumaker & Boyce back geared Engine Lathe.
B 3B 1—32″ x 20′ New Haven Engine Lathe.
B 2B 1—34″ x 8′ Putnam back geared Engine Lathe.
L 29A 1—36″ x 22′ 0″ Putnam Lathe.
L 17A 1—27″ x 20′ American Lathe.
D 17A 1—20″ x 10′ 8″ Walcott Engine Lathe.
W 51A 1—18″ x 10′ Walcott Engine Lathe.
W 52A 1—19″ Sidney Engine Lathe.
W 53A 1—New Haven Pipe Facing Lathe.
D 34B 1—28″ x 16′ 4″ New Haven Single Back Geared Engine Lathe.
D 91A 1—26″ x 18′ 6″ Walcott Double Back Geared Engine Lathe.
D 23B 1—30″ x 23′ 11″ Pond Single Back Geared Engine Lathe.
D 35B 1—21″ x 10′ 5″ bed Hamilton Double Back Geared Engine Lathe.
D 51A 1—30″ x 37′ 6″ Wickes Double Back Geared Engine Lathe.
D 11A 1—26″ x 14′ 6″ Walcott Double Back Geared Engine Lathe.
D 90A 1—26″ x 16′ 5″ Walcott Double Back Geared Engine Lathe.
D 52A 1—No. 9 Empire Irregular Type Wood Turning Lathe.

## TURRET LATHES

D 5B 1—Bardons and Oliver Turret Lathe.
D 9B 1—Warner and Swasey Turret Lathe.
D 83B 1—Bardons and Oliver Turret Lathe.
W 27B 1—Foster Machine Company Turret Lathe.
D 16A 1—18″ x 8′ Walcott.
D 50A 1—Lathe, 24″ Gisholt Turret.
D 37A 5—2¼″ x 10″ Mulholland Turret Screw Machines.
D 68A 3—1⅝″ x 10″ Turret Lathe Screw Machine.

## Flanging Press

CL 18A 1—200-ton Southwark Hydraulic.
L 12B 1—Morgan Engineering Works 75-ton Hydraulic Flanging Press.

## Saws

S 27B 1—24″ Newton Cold Saw. Will cut up to 6″ square.
D 60A 1—No. 18 Lea Simplex Cold Metal Saw.
1—Saw Sharpening Machine for Lea Simplex Cold Saw.

## AIR RECEIVERS

S 48A 1 Ingersoll-Rand No. 7, Vertical Steel Air Receiver, 54″ x 12′, complete with all fittings.
B 14A 2—54″ x 12′ Chicago Pneumatic Vertical Air Receivers.
Ch 50A 1—42″ x 10′ Kewanee Vertical Air Receiver.
CL 49A 1—48″ x 9′ Kewanee Vertical 2 course Air Receiver.
L 1A 1—36″ x 9′ Vertical Two Course Air Receiver.
L 37A 1 48″ x 12′ Vertical Air Receiver.
L 37A 2—54″ x 12′ Kewanee Vertical Air Receivers.

## CARS

CL. 11A 1—Saddle Boiler Car, 32′, 4″ long overall; capacity 70 tons. Built to M C B requirements, all steel construction.
CL. 103A 2—Saddle Boiler Cars, M C B requirements, all steel construction, 32′ 4″ long overall; 30′ long, not including couplers.

## PIPE MACHINES

Ch. 33A 1—D Saunders Pipe Machine, capacity 1″ to 4″.
Ch. 46A 1—Crane Co. Pipe Machine, capacity 1″ to 4″, Eaton Cole and Burnham Type.
B 12A 1—Lovekin A Pipe Expanding and Flanging Machine, capacity, 2″ to 6″.

## Hoist—Electric

Ch. 54A 2—Thomas Double Drum Hoists, band friction type with reverse mechanism for slewing.

## Generators

B 25B 1—Fairbanks Morse 2½ K.W., 115 V, type T R, Generator.
CL. 37B 1—30 K W Card, 240 V, 775 R.P.M., belt drive.

## Bolt Cutters

S 19A 1—2½″ Acme Bolt Cutter.
S 50B 1—Acme Single Bolt Cutter, 1½″ to 2″ capacity.
CL. 26A 1—1½″ Merriman Single head.
CL. 47A 1—4″ Landis Single head.
D 82B 1—3½″ National Bolt Cutting Machine.
D 25B 1—1½″ Acme Bolt Cutting Machine.

## Nut Tapping Machine

D 42A 1—Nut Tapping Machine; 10 Spindle.

## Transformers

Ch. 49A 3—833 KVA General Electric Type, WC, form BDH, 60 cycle, transformers.

## Hammers

L 31A 1—2,000-lb. Bement Single Frame Steam Hammer.
L 31½A 1—2,400-lb. Bement Single Frame Steam Hammer.

## Planers

D 81B 1—24″ x 24″ x 6′ Pease Planer.
W 23B 1—36″ x 36″ x 10′ Pond Planer.
L 16A 1—72″x72″x20′ Standard Cincinnati closed side Planer.
L 27B 1—48′ x 48″ x 16′ Pond Planer.
CL. 50A 1—48″ x 48″ x 20′ Patch Planer.
B 24A 1—60″ x 60″ x 20′ Sellers closed Side Planer.

## Woodworking Machinery

B 23B 1—McKinnon Wood Cutting Jig Saw, with semi-universal head.
B 21B 1—15″ Fay & Egan Four side "Lightning" Planer and Matcher.

## Air Compressors

S. 17A 1—2,000 Cu. Ft. class P R E. Ingersoll Rand.
S. 48B 1—Franklin double stage Air Compressor.
W 39A 1—Laidlow 2 stage tandem compound horizontal steam driven Air Compressor.
Ch. 28B 1—150 Cubic Ft. Sullivan.
CL. 57B 1—Chicago Pneumatic 1,200 Cubic Feet steam driven cross compound, 2 stage.

## Air Compressor --- Electric

B 13B 1—1,100 Cubic Ft. Class WN, No. 3 Sullivan Angle Compound, 20″ and 12″ x 14″; direct connected to 225 H P., 2,200 V., 214 R P M., 3 phase, 25 cycle, Electric Machinery Synchronous Motor with exciter.

## STOCKS OF

**Contractors' and Builders' Supplies—Electrical Supplies—Plumbing Supplies—Ship Hardware and Supplies—Bolts, Nuts, Rivets and Washers—Steel Plates, Shapes, Bars, Etc.—Air and Water Hose—Pipe and Fittings.**

**Write or telegraph us for our catalogs, prices, and full particulars.**

THE

# American Ship Building Company

## Foot of West 54th St., N.W.

## CLEVELAND, OHIO, U.S.A.

## Grinders

Ch. 23A 2—12″ Willey double Emery Wheel Grinders.
D 100A 1—Drill and Cutter Grinder, Wilmarth and Morman Co. Mfrs. Serial No. 10,-602—JBX.
D. 19A 1—Combination Cutter and Grinders, Wilmarth and Morman Yankee.
D. 102A 1—Yankee Drill Grinder and Cutter.
D. 47A 1—Grinding Machine, No. 5 Ransome.
D. 49A 1—No. 8B Ransome Dry Tool Grinder.
D. 76B 1—Double Emery Grinder.

## Locomotives

L 12A 1—48-ton Schenectady Locomotive, 4 wheel type, 4′ drivers, 46½x16″ boilers, air brakes.
D 118A 1—Plymouth 6-ton Gasoline Locomotive

# LOOK OVER THIS LIST!

## Many Good Opportunities in Used Tools Here

### BORING MILLS

10′ to 16′ extension type, swings 11′ 2″-20′ 2″.
60″ x 5′ horizontal, back geared.
54″ x 10′ horizontal, back geared.
42″ x 12′ horizontal, back geared.
42″ vertical car wheel boring and facing machine.
34″ London, vertical.

### DRILLS

11′ Bertram, rail type, 6 spindle, adjustable heads.
Gardam, multiple, medium capacity, 6-spindle.
D-8 Colburn, heavy duty, B.G.
No. 16D "Hole Hog" multiple, 4-spindle.
D-4 Colburn, heavy duty.
No. 4 Colburn, heavy duty, B.G.
20″ Barnes, 3-spindle manufacturers.
20″ Colburn, 4-spindle, heavy duty, B.G.
18″ Sipp, 2-spindle, quick-change speed.
17½″ Allen, sensitive, 4, 5 or 6-spindles.
15″ Avey, 4-spindle, ball bearing, lever feed.
70—Upright drills of various makes, from 7″ to 40″ capacity.
25—Bench drills, from 6″ to 15″ capacity.
14—Post drills, from 12″ to 21″ capacity.
12′ and 14′ arm, wall radials.
8′ semi-universal radial.
5—Radials, from 30″ to 52″ capacity.

### GRINDERS

2—No. 106 Rivett, automatic internal.
No. 2½ Bath, duplex internal.
No. 205 Rivett, radial.
No. 3 Brown & Sharpe, universal with internal attachment.
No. 200 Heald, ring and surface, 8″ magnetic chuck.
No. 3 Gardner, disc, 14″ ring wheel chuck.
No. 2 Cincinnati, 12″ x 36″ plain.
2—10″ x 30″ Landis, plain.
2—12″ x 36″ Landis, plain.
18″ x 7′ Stringertype surface.
4—Twist drill grinders.
4—Plain surface grinders.
9—Universal tool and cutter.
7—Plain tool grinders.
30—Pedestal, various makes and sizes.
10—Bench, various makes and sizes.
2—Electric grinders.

### GEAR MACHINES

No. 6 Fellows gear shaper, 26″-36″ capacity.
36″ Fellows gear shaper.
No. 2 Barber-Coleman hobber, 3″ x 7″ capacity.
No. 1 Farwell gear hobber.
24″ Brown & Sharpe, automatic spiral gear cutter.
12″ Rochester, gear tooth rounder.

### POWER HAMMERS

1500-lb. Bement, steam driven.
700-lb. Bertram, steam driven.
350-lb. Sellers, steam driven.
800-lb. board lift, drop.
40-lb. Bradley, helve hammer.
2—No. 4-A High Speed riveting hammers.
Pettingell base plate.

### KEYSEATERS

No. 0 Chattanooga.
No. 1 Davis.

### TURRET LATHES

10—No. 6-A Potter & Johnston, automatic.
10—No. 4 Foster, friction head.
26—No. 4 Wood, friction head, tilted turret.
No. 4 Warner & Swasey, universal.
No. 3-A Warner & Swasey, hollow hexagon.
2—No. 3 Foster, plain head.
41—2¼″ Gridley, single spindle, automatic.
2¼″ Cleveland, automatic.
4—¾″ National, multiple spindle, automatic.
2—⅞″ x 2½″ Brown & Sharpe, automatic screw machine.
2—2″ x 24″ Jones & Lamson, flat turret.
2—27″ x 10′ C.M.C., heavy duty.
6—26″ x 10′ Steinle, geared head.
4—24″ x 9′ Gisholt, B.G., friction head.
50—Other turret lathes of various makes and sizes.

### ENGINE LATHES

130—Engine lathes of various makes and sizes from 8″ to 32″ swing.
24″ x 12′ Advance, D.B.G.
21″ x 12′ Sidney, D.B.G.
20″ x 12′ Lodge & Shipley, selective head.
2—18″ x 10′ Sidney, medium pattern, manufacturing.
18″ x 10′ 3″ Lodge & Shipley, D.B.G., 3-step cone.
16″ x 5′ Reed, automatic, single pulley drive.
3—16″ x 8′ Sidney, D.B.G.
16″ x 8′ South Bend, quick change gear.
14″ x 6′ Mulliner, tool room lathe, with pan, taper attachment, draw-in attachment.
14″ x 6′ Sidney, quick change gear.
No. 504 Rivett precision, bench type.
No. 505 Rivett precision, bench type.

### GAP LATHES

30″ x 44″ x 23′ London, B.G.
26″ x 44″ x 20′ Bertram, B.G.
24″ x 44″ x 16′ or 20′ bed, C.M.C.
22″ x 40″ x 14′ Rae, D.B.G.
18″ x 32″ x 10′ McDougall, D.B.G.
13″ x 20″ x 5′ back geared.

### MILLING MACHINES

N. 2 Cincinnati, vertical, high power.
No. 3 Brown & Sharpe, universal.
No. 3 Cincinnati, universal, cone type.
No. 2 Cincinnati, universal, cone type.
No. 2-M Cincinnati, universal.
No. 1½ Cincinnati, universal, cone type.
No. 2 Owen, universal.
No. 1-M Cincinnati universal.
No. 2 Lincoln type.
No. 1 Brown & Sharpe plain oil pan, pump and pipe.
2—18″ Cincinnati, plain, B.G.
2—No. 6 Whitney hand millers.
14—No. 1 Burke bench millers.
Nos. 3 & 4 Thurston die millers with die sinking attachment.
No. 3 Becker-Brainard vertical milling attachment.
14—Thread millers.

### IRON PLANERS

36″ x 36″ x 10′ x 12′ Belmer-Eames, 4 heads.
30′ x 12′ x 8½′ Smith & Tannant, 29′ x 8′ table.
60″ x 40″ x 10′ London, 2 heads.
40″ x 37″ x 12′ Fitchburg.
38″ x 38″ x 7½′ London.
36″ x 36″ x 10′ Gray, 2 heads.
32″ x 32″ x 10′ Gray, 2 heads.
30″ x 30″ x 8′ Gray.
26″ x 26″ x 8′ Putnam, 2 heads.
24″ x 24″ x 6′ London.
20″ x 20″ x 5′ London.

### PRESSES

5— No. 857 Toledo drawing presses.
No. 355 Toledo drawing press.
Zeh & Hahnemann, horizontal, B.G.
No. 2-C Consolidated, inclinable.
5—Brown-Boggs, power presses.
8—Bliss, power presses.
3—20-ton garage screw presses.
5—No. 0 Hercules, bench, power.

### PUNCHES AND SHEARS

Bertram double end punch and shear, 42″ throat, capacity of punch 1½″, shear 8″.
Edwards double end punch and shear, capacity of punch 2″ shear 6″ x 6″.
1″ Cleveland style "C", single end punch.
1″ Bertram, horizontal punch.
No. 5 Pels, universal, portable punch.
6″ x 6″ Bertram, double angle shear.
3/4″ Lennox, rotary plate bevelling shear.
No. 214 Stoll, rotary, circle and slitting shear.

### SHAPERS

2—24″ back geared with swivel vise.
7—16″ back geared.
10″ x 54″ traverse head.

### MISCELLANEOUS

18—Arbor presses.
3—Bolt Cutters and Threaders.
7—Pipe Machines.
8—Cutting-off Machines.
16—Hack Saws.
Williamson metal band saw.
Complete outfit for making metal fly screens.
Beatty self-propelling derrick car.
5—ton revolving crane, 25′ boom.

# GOOD OPPORTUNITIES IN USED MACHINERY

**Vertical Boring Mills**

2—30″ London Machine Tool.
1—42″ Bullard.
1—44″ Bertram.

**Horizontal Boring Mills.**

1—4″ Bar, Beaman & Smith. floor type.
2—4″ Bar, Bertram, elevating table.

**Bolt and Nut Machines.**

1—2-Spindle Nut Tapper, ½″.
1—½″ to 2″ Bolt Cutter.
1—¾″ National Nut Forging Machine.
1—2″ Acme Bolt Header.
1—4-Spindle Bertram Nut Tapper.
1—Blake & Johnson Thread Rolling Machine.
1—¼x½″ Pawtucket Cold Nut Press.

**Boring Bar.**

1—8″ x 7′ Canada Foundry.

**Blowers.**

1—No. 4 Roots Pressure Blower.
2 27-Cubic-foot Connersville.

**Drilling Machines.**

1—12″ Perfect Sensitive.
1—14″ Excelsior.
1—20″ Bertram, sliding head.
2—20″ MacGregor-Gourlay.
1—25″ W. F. & J. Barnes.
1—20″ Prentice.
1—3′ Gang Radial.
1—3½′ Stevens Hamilton Radial.
1—5′ Western Radial.
1—6′ Western Radial.
1—5′ Bickford Full Universal Radial.
1—4′ London Semi-Universal Radial.
1 6-Spindle Crosby Mud Ring.
2—12′ MacGregor-Gourlay Plate Radial.
1—3′ MacGregor-Gourlay Wall Radials.

**Grinders.**

18—Miscellaneous Pedestal Emery Grinders.
1—8″ Goddard Ring Grinder.
1—40″ Canada Foundry Piston Ring Grinder.

**Hydraulic.**

1—150-ton Hydraulic Wheel Press, 46″.
1—No. 2 W. H. Wood Joggling Machine.
12—Hydraulic Forging Presses, 200 to 350-ton.

**Plate Planer.**

1—18′ Niles.

**Rotary Planer.**

1—36″ Bertram on turntable.

**Lathes.**

2—16″ x 6′ Canedy-Otto.
1—16″ x 6′ MacGregor-Gourlay.
1—16″ x 8′ Cleveland.
3—14″ x 5′ Bertram.
2—16″ x 6′ London.
1—16″ x 8′ Lodge-Shipley.

1—26″ x 18′ Bullard.
1—24″ x 12′ Schumacher & Boye.
1—40″ x 18′ London.
1—20″ x 34″ x 10′ London Gap.
1—18″ London Fox Turret.
3—No. 4 Bartons & Oliver Turrets.
8—6A Potter & Johnson.
6—1½″ Wood Turret Lathes.
5—16″ Bawden Single Purpose.
1—100″ Bertram Wheel Lathe.
1—Bertram Axle Lathe.

**Milling Machines.**

1—No. 13 Brainard Universal.
1 –No. 2 London Plain.
1—No. 3 Cincinnati Plain.
1—No. 3 Bertram Plain.
1—42″ Newton Vertical.
1—24″ Bertram Slab Miller.
1—40″ Bertram Slab Miller.
1—54″ Newton Slab Miller.

**Metal Planers.**

1 30 x 30 x 10′ London.
1—30 x 30 x 8′ Bertram.
1—40 x 40 x 10′ Bertram.
1 –87 x 60 x 16′ London.
1—48 x 48 x 14′ Stirk.
1—106 x 84 x 28′ Bertram.

**Plate Rolls.**

1—27′ Allis-Chalmers Plate Bending Rolls, 27″ diameter, top roll, capacity 1¼″ plate.
1—9′ 6″ Bertram Plate Straightening Rolls, 12″ diameter, rolls 1″ plate.
1—8′ Smith Bros. Plate Straightening Rolls, 10″ diameter, rolls 1″ plate.

**Bull Riveters.**

1—42″ Hanna.
1—36″ Hanna.
1—36″ Allan.
1—24″ Allan.
1—18″ Allan.
1— 9″ Allan.

**Iron Shapers.**

1—20″ Bertram.
1—20″ Hendey.
1—24″ Morton.
1—30″ Morton.
1—14″ Bertram Traverse.
1—16″ Hand Traverse.
1—16″ Broadbent Traverse.

**Slotting Machines.**

1—10″ Crosby with rotary table.
1—24″ Bertram, triple head for locomotive frame.

**Saws.**

10—Racine Saws, 6″ and 10″ cap.
1—No. 1 Newton Cold Saw.

**Woodworking Machinery.**

1—MacGregor-Gourlay Rip and Cross-cut Saw.
1—32″ Crescent Band Saw.
1—24″ MacGregor-Gourlay Planer and Matcher.
1—12″, 4-side MacGregor-Gourlay Moulder.
1—MacGregor-Gourlay 54″ Band Resaw.
1—MacGregor-Gourlay 4′ x 8′ Door Clamp.
1—MacGregor-Gourlay 42″ x 6′ Sash Clamp.
1—MacGregor-Gourlay 6″ 4-side Sticker.
1—MacGregor-Gourlay 48″ 3-drum Sander.
1—MacGregor-Gourlay Mortiser.
1—MacGregor-Gourlay Horizontal Borer.
1 MacGregor-Gourlay 5″ Tenoner.
1—MacGregor-Gourlay Railway Cut-off.
1—MacGregor-Gourlay, 2-Spindle Shaper.
1—MacGregor-Gourlay 20″ Wood Lathe.
1 MacGregor-Gourlay 16″ Buzz Planer.
1—Foy-Egan 12″ Buzz Planer.
1—MacGregor-Gourlay "Daniels" Timber Planer.

**Miscellaneous.**

23—Miscellaneous Toledo Presses.
2—2″ Pipe Machines.
2—4″ Pipe Machines.

**Punches and Shears.**

1—Cleveland Beam Punch and Coping Machine, 31″ throat, 24″ beams.
1—Bertram, double end, 1″ x 1″, 32″ throat.
1—Long & Allstatter Bending Machine, 15″ beams and channels.
1—1¼ x 1″ Cleveland Horizontal Punch.
1—8 x 8 Bertram Angle Shear.
1—Hillis & Jones Splitting Shear, capacity 1″.
1—Bertram Beam Coping Punch, 24″ beams.
1—Bertram Double End Punch and Shear, 1″ x ¾″, 30″ throat.
1—T-40 Pells Beam Shear, 15″ beams and channels.
1—Double End Corbett, ½ x ½ x 24″ throat.
1—Double End Long & Allstatter, ¾″ x 1, 18″ throat.
1—Double End Smith, 1″ x 1″, 30″ throat.
1—Single End C.M.C., 1″ x 1″, 30″ throat.
1—60″ C.M.C. Gate Shears, 1″ capacity.
1—¾″ Wagner Rotary Shear.

## DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

### MACHINE TOOLS AND METAL WORKING EQUIPMENT

# HENDEY

## Lathes–
## Shapers–
## Millers–
## Centering
## Machines

HENDEY machines by their efficient performance have earned an unexcelled reputation for speed, for unfailing accuracy and for ease of manipulation.

This Hendey reputation is a factor worth considering when searching for thoroughly reliable lathes, shapers, millers or centering machines.

## The Hendey Machine Company

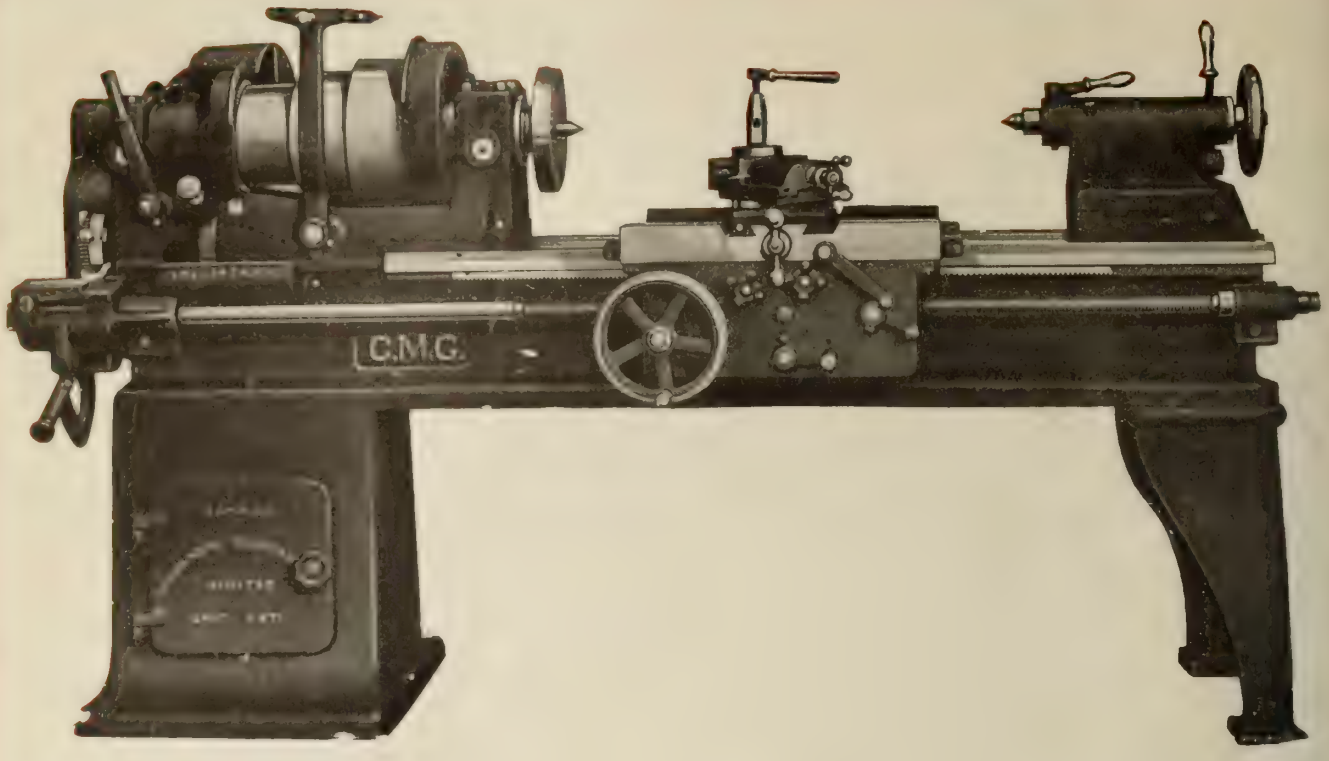
# Have You the Missing Tool?

For laying out work any Starrett dealer can supply you with as many as twelve Bevel Protractors, three Universal Bevel Protractors, or twelve Combination Sets, which include slide, square, center and protractor heads.

Six of the Bevel Protractors are made with the head extending over both sides of the blade. Of the three Universal Protractors, two are equipped with verniers.



Have you the tool this man should be using? Look it up in Catalog No. 22 "3".

# Use Starrett Tools

C.M.C. 16" x 6' Engine Lathe

## *Which Do You Want?*

A Lathe that is built of the best materials money can buy and by skilled Canadian Mechanics, or one that is indifferently fitted up and the materials available "made to do."

A Lathe that is built accurately and tested carefully before it is shipped, or one that is "good enough."

Investigate the merits of the C. M. C. Lathe. You will see throughout its construction evidences of careful workmanship and painstaking care in the choice of metals. You get full value for your money when you buy a C. M. C. Lathe.

# SMALL TOOLS

## *Pratt & Whitney Adjustable Blade Reamers*

These reamers have eccentric relief and can be set to size without regrinding. They are unexcelled for design and simplicity and ease of adjustment.

The eccentrically relieved blades are stronger than others, do not chatter, and produce a smoother hole. The hand, shell and fluted chucking reamers have interchangeable nuts, screws and wrenches. The bottom of a hole can readily be faced.

By a simple adjustment of the blades the reamer can easily be set to size, without regrinding.

*Prompt service is assured at our nearest store, where P. & W. Small Tools are carried in stock for immediate delivery. Place your order there to-day.*

# The New Canadian-Detroit Double-D Rolled Drill

***Made in Canada***

PRODUCTION requirements in an ever-increasing number of plants necessitate the use of a strong, accurate drill, specially designed for hard drop forgings, steel castings, and other alloy steels equally tough and difficult to drill.

For this service we have developed a hot rolled process drill known as the Canadian-Detroit Double-D (DD) Rolled Drill. It combines the strength of the forged type drill with the accuracy and uniformity of the milled type.

The flute of the DD is formed straight from the bar stock by successive passes through specially built and patented rolls at a temperature of 1850° F. This mechanical rolling of the flutes produces a refinement and uniformity in the grain of the steel and gives additional density at the centre and at the outer edge. Each drill is rolled separately, and the rolls are so designed and operated as to produce the same uniform increase in web thickness as is obtained in high-grade drills of the milled type.

The fluted drill is reheated and twisted in a specially designed automatic machine. The twisting process is held absolutely uniform, giving the same increase in helix angle from shank to point, 27° to 32°. This standard has been adopted on our milled drills and has been proven by exhaustive experiments to be the most efficient.

The DD has increased production and cut drilling costs in many of the finest plants in Canada. A fair test will convince you.

Manufactured and carried in stock at Walkerville in all sizes from ½ inch to 1½ inches.

We also manufacture and carry in stock all sizes and types of high speed and carbon milled drills.

# Cincinnati Acme

Cincinnati Acme Turret Lathes are adapted to both bar and chucking work. We offer a full line for your every requirement.

## *Don't Merely Ask for Efficiency—Get It!*

Have you often wondered why production sometimes falls a little behind on certain jobs? Perhaps it's your lathes.

Cincinnati Acme Turret Machinery will give fast, accurate and economical production. Once installed in your shop you will find that their double purpose features and sturdy, rigid construction save power and get your work out ahead of schedule.

Writing us a postcard may be your first step toward increased production and greater lathe economy.

# Cleveland Sand Rammers

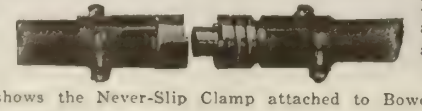
## FOR FLOOR, BENCH, PEIN AND FLASK RAMMING

Cleveland Sand Rammers are made in several sizes and weights, and are adapted for all kinds of Foundry Ramming.

The Piston Rods are packed with a resilient packing which prevents any dirt from entering piston chamber and working parts—They are fitted with either Round or Flat Rod as required. Cleveland Rammers are light in weight, have high speed and practically no vibration, making them ideal foundry tools.

## CLEVELAND CHIPPING HAMMERS

For Foundry Work. Are furnished in any required size or weight for grey iron or steel castings; they have high speed, and are adapted for fast chipping now required by piece-workers.



## CLECO PRESSURE-SEATED AIR VALVES AND BOWES AIR HOSE COUPLINGS

**Are Standard Equipment Everywhere**

***Both Valves and Couplings are pressure tight.***

Bowes Couplings are instantly connected or disconnected.

Bowes Couplings are absolutely air tight under all pressures.

Above cut shows the Never-Slip Clamp attached to Bowes Coupling.

# For Your Shop Air Supply

Class "EL-1" Single Stage, Straight Line, Power Driven Compressor has a higher capacity for weight and floor space than other machines of its type on the market and is characterized by such worthwhile features as entirely enclosed dust-proof frames, automatic lubrication at all speeds, silent leaf valves, etc. Specially adapted to short belt motor drives. An ideal unit for the small shop or as an auxiliary in larger plants. Smaller sizes shipped from stock. Fully described in Bulletin K-300-C.

An unfailing supply of compressed air is a manufacturing necessity in these days of keen competition and close buying.

The installation of a Canadian Ingersoll-Rand Compressor is the simplest and best means of establishing a satisfactory air service in your plant.

Made in a score or more sizes and styles, there is one for every air compressing need and for every type of drive.

Perfected design, modern production methods and high manufacturing standards gained through years of specialization in this field, ensure satisfaction from the standpoints of prompt shipment, moderate first cost and high operating economy.

Whenever you are planning on the provision or extension of air power in your shop you will want our catalogues at hand for consultation. Better send for them now.

MAPLELEAF

# MOTOR TRUCKS

## On a Steep Hill With a Heavy Load

THE driver has got to shift gears in a hurry. That is the time he is glad the truck has a Mapleleaf transmission in it.

For Mapleleaf transmissions have ample multiplying power. The 5 ton model, for example, multiplies 6 times on lowest speed and gives two other changes between that and high. Enough to overcome any hauling problem you will run up against, isn't it!

All changes are made simply and easily. The gears change quietly and effectively. The whole transmission system is of the most rugged type imaginable.

Let us show you a Mapleleaf truck winning an argument with a wicked hill. You will know we haven't said all we might about the merits of its transmission.

# THE JOHNSON FRICTION CLUTCH

## The Case Against the Countershaft

The old familiar countershaft drive, through cross belts and tight and loose pulleys, stands accused of the following offences against efficiency.

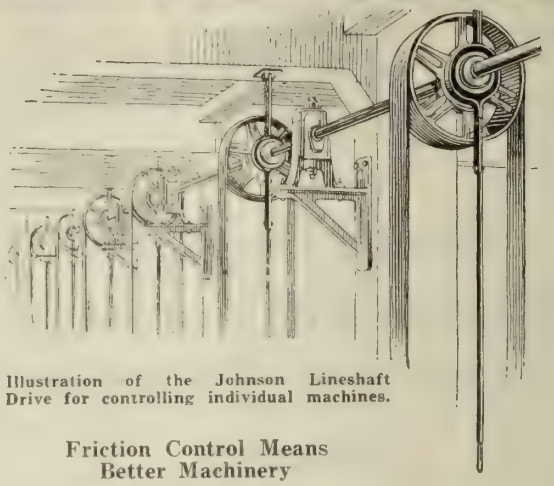
In that it—

1. Involves needless equipment.
2. Costs too much to set up.
3. Prevents economical and systematic use of space.
4. Operates sluggishly.
5. Multiplies belt troubles and the resultant cost of upkeep.

Modern practice has discarded the antiquated countershaft for the simplicity and efficiency of the clutch drive direct from lineshaft.

**Adopt the Johnston Lineshaft Drive**

The economical, efficient and durable method of power transmission through friction control.



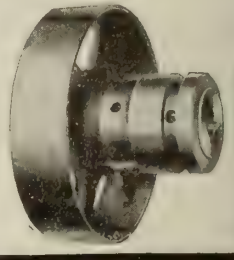


Illustration of the Johnson Lineshaft Drive for controlling individual machines.

**Friction Control Means Better Machinery**

Whether it is applied overhead or in the machine itself.

**Write for our Booklet "Clutches as Applied to Machine Building" and our Yellow Catalog.**

# The "Lehmann" Improved Selective Head Lathes

**(Patents Pending)**

**SIZES—14" to 24" SWING**

On account of its simplicity of construction, great driving power and rigidity, ample range of speeds, moderate tooth travel of its gears, compact and shapely appearance, the "LEHMANN" Selective Head Engine Lathe stands to-day in a class *ahead* and *alone*. Some of the features of construction are:

Sixteen Spindle Speeds in correct geometrical progression obtained with the use of only ten gears.

Improved Friction Clutches (Patents Pending) running in oil, requiring no adjustment and giving forward and reverse control to spindle.

Heat-treated or Hardened Steel gears.

All Shafts, except spindle, running on ball bearings.

Spindle of alloy steel, hardened and ground at the bearings and running in phosphor bronze boxes.

Head Casting forms oil-tight case enclosing all running parts.

In addition these lathes embody all features such as the patent quick change mechanism, the tailstock spindle locking device, the rod and screw shift, etc., forming part of the "LEHMANN" Cone Head Lathes which have acquired an enviable reputation for accuracy and production.

*Let us describe more fully this Exceptional Lathe and its Distinctive Advantages*

# FORD-SMITH DISC Grinders

## High-Class Made-in-Canada Machines

MACHINES which bear a reputation for doing quicker, better work, and whose upkeep expenses are practically nil, merit investigation.

Such machines are Ford-Smith Disc Grinders; every model of the Ford-Smith line—and there's a model for practically every purpose—is designed to give *quality* production as well as *quantity*.

Before leaving the factory all Ford-Smith Grinding Machines are subjected to a series of exacting tests, covering every detail of their construction. These tests *prove* that the machine is capable of filling all our claims.

Many manufacturing operations show possibilities of exceptional economies by the use of suitable grinding processes. Have one of our engineers call and see just what saving grinders would effect on your work.

***Any information with regard to Ford-Smith Grinders will gladly be furnished.***

## Desmond Removable Jaw Dresser

The wear on Huntington Dressers is at the "nose," directly in front of the bushings. To obviate this trouble the Desmond Removable Jaw Holder, shown on this page, was designed. When the specially hardened jaws become worn, a new set is adjusted in the V-shaped sides of the handle, and held in place with a jaw nut placed over the countersunk nut, thus renewing the dresser.

**Write for catalog of our complete line of dressers and accessories.**

# Williams' Superior Drop-Forged Wrenches

It's great to be able to "lean" on your wrench and give a husky, full-arm swing, secure in the knowledge that it will stand any strain that may be applied. It's confidence that the wrench is dependable that makes the work a pleasure and the tightening-up job real play.

Williams' Superior Drop-Forged Wrenches are regular "he" wrenches; they do a man's work in a man's way; they take the hard with the easy jobs, as they come; they do not round and batter the corners of nuts and cap-screws, because they fit; neither do they slip, for the same reason.

There's a Williams' Wrench for every purpose—40 Standard patterns in nearly 1,000 sizes with openings from 3-16 to 7 5-8 inches. Also Screw Wrenches, Adjustable Wrenches, Stillson Wrenches, "Bull Dog" Wrenches, Auto Wrenches, Chain Pipe Wrenches, etc., etc. Ask your dealer.

Wrench Book on request.

# Why should I buy GTD Taps and Dies?

AS you turn the pages of the magazines and note the many advertising announcements—you must often have asked this question:

"Are all taps and dies alike?"

If they are, then your decision is influenced mainly by the attitude of the people who make them—their friendliness, their understanding of your needs, and their aggressiveness in urging you to buy their product instead of some other.

If taps and dies are *not* alike, how do they differ?

Take the matter of metal buying—or heat treatment, or uniformity in production. Some products excel over others in each case. Or consider accuracy, rapidly becoming a first consideration in buying taps and dies. Or such elements as adaptibility or application!

Consider GTD with these fundamental differences in mind. Think of the tap and die specialties now so universally used which are ours and were first made by us:

The Button Die
The Round Adjustable Split Die
The *"Little Giant"* Die
The *"Acorn"* Die
The *"Gun"* Tap
The *"Maxi-Staybolt"* Tap, etc.,

In all of these tools there are *differences* which distinguish them from taps and dies so often thought of as "all alike."

Back of these differences is the pioneer work in screw-cutting tool manufacture, of Wiley & Russell, Reese, Wells Brothers—names that have stood and still stand for the painstaking effort that only real genius gives to its task.

No, taps and dies are not all alike. There are differences that most observers can detect. And these differences which make it worth any tool-user's while to look for the GTD trademark and *insist on it*—are the things on which our advertising and our salesmanship put the emphasis.

## *Screw Thread Text Books Free*

*Our catalogs and descriptive booklets on GTD threading tools are really text books on the subjects they cover and as such are valuable to any shop worker or executive. Let us mail them to you without cost. Use the coupon and indicate whether you are using production or repair tools or both.*

# THE LANDIS
## Ideal for Staybolt Threading

The above Landis Threading Machine photographed at the plant of the Bigelow Company, New Haven, Conn., has been in operation for three years, during which time it has seen steady service, threading 1⅛-in. stock for staybolts.

At no time have they been forced to cease operation on this machine owing to repairs, etc. The use of Landis Threading Machines, with their sturdy construction and superior type die head, has proven that "Landis" means more threads per hour, more hours of threading, and the consequent "more threads per dollar."

Be guided by "Landis" performance of "More threads per dollar."

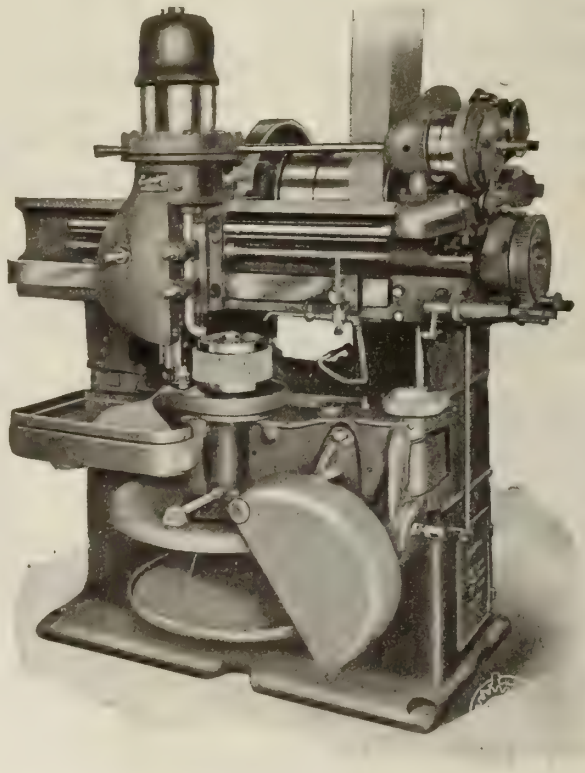
# Gear Cutting With the "IFS" Left Out

## The Gear Shaper Way



A production manufacturer knows that he will secure good gears IF he has an accurate cutter, an accurate machine and a machine working on the correct principle. The whole question of good gears is resolved in this one little word "IF."

When the Gear Shaper was originally designed, the question of "IF" was taken into consideration and every possible means known to mechanical engineering was employed to eliminate the "IFS" from gear cutting.

That we have been successful in solving the problem is evidenced by the fact that each ensuing year sees a larger number of manufacturers adopting the Gear Shaper method.

How the Gear Shaper has accomplished this is clearly explained in our general catalog "Commercial Gear Cutting," which is a treatise on the subject of:—
Gear Cutting with the "IFS" Left Out.

**Send for your copy to-day.**

The Fellows Gear Shaper—the machine which has taken the "IFS" out of gear cutting.

# Small Machine Shops, Auto Repair Shops Welding Companies

# *Do you want a business like this?*

A day's work laid out at the repair shop of Geo. H. Woodwards, San Francisco

### Opportune Time

There is no business to-day that has the possibilities and which fits so nicely into a small machine shop, automobile repair shop, or a concern doing welding, as the regrinding of worn or scored cylinders.

Many companies would have had to close their doors this Spring but for the business obtained through regrinding. It does not require skilled mechanics for operators, and the profit received on the capital invested is unusually large.

### The Field for Regrinding

There were over 9,000,000 commercial and pleasure cars registered during last year. Truck and tractor cylinders require attention once a year. Passenger cars should be looked over at least once every two or three years. Figure out for yourself what your chances are with only approximately 350 concerns properly equipped for such work. Consider also the fact that three 4-cylinder blocks a day will bring profitable returns.

### Advantages to the Automobile Owner

Reground cylinders fitted with new pistons and rings will give the motor as much, if not more, power and pep than when it was new. It cuts the oil and gas consumption in two and stops all excessive smoking.

### Necessary Equipment

Eighty-four per cent. of all pleasure cars, and ninety-one per cent. of all commercial motors manufactured are ground, and Heald Machines are used exclusively. The Style No. 55 is built expressly for regrinding work. It is simple, moderately priced, self-contained, and has a very large capacity and range, easily taking care of singles, doubles, four and six en bloc cylinders.

In addition, to handle the work satisfactorily, one should have a small lathe and drill press, bench and hand tools. A small external grinder would be convenient for finishing pistons, thus enabling the shop to purchase semi-finished pistons and grind them to the oversize required.

**Now is the logical time to get started. If you want figures, in addition to the above facts, write, wire or 'phone**

## The Heald Machine Company

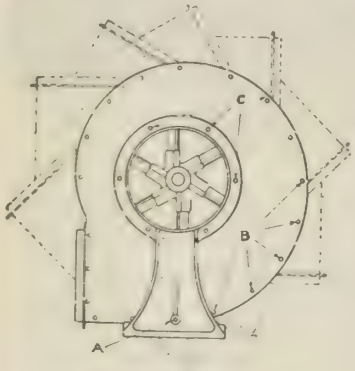
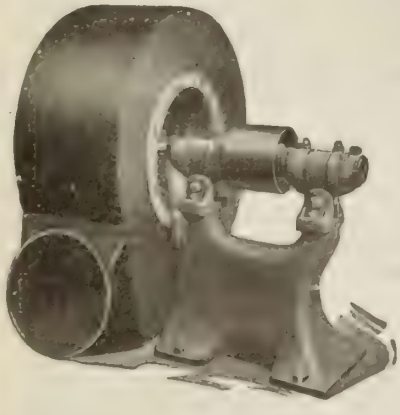
# Canadian



The Canadian Standard Reversible Mill Exhauster will keep your shop clean, remove sawdust, shavings, fumes, gas or any loose materials and disagreeable odors.

Insurance rates can be reduced; floors and machines covered with sawdust, chips or shavings, increase the fire risk.

Insurance companies reduce the premiums where adequate precautions have been taken to prevent fires.



Blast Wheel — This wheel is so constructed that it will handle any kind of stringy material efficiently, such as sawdust, shavings, cotton lint. Will also handle gases, fumes, smoke, etc.

The Canadian Standard Planing Mill Exhausters have reversible housings so that the outlet can be adjusted instantly to any angle desired.

This eliminates necessity of crossed belts. Simplifies changes on alterations in piping or building.

The housing is of heavy rolled steel plate securely bolted together with angle irons. Round cast iron outlet bolted to the housing. Blast wheel mounted on heavy cast iron spider.

Every fan carefully tested by running test at speeds in excess of that required.

Franklin Die-Castings for Aeroplane onstruction

# Rapid Strides in Communication

Remember the old Pony Express? It averaged about eight miles an hour. Now fast mail coaches and mail-service aeroplanes travel *eighty* miles an hour.

This progress in communication has come about only within the last few decades. Franklin Die-Castings have aided this development by their use both in mail-coach equipment and in aero engines.

In 1892 we originated the Die-Casting Process. For nearly thirty years we have been reducing the cost and simplifying the output in many fields of industry. The addition of the standard No. 12 Aluminum to the Tin, Lead and Zinc base alloys already in use has enabled us to meet a still wider range of individual needs.

*We quote from samples or blueprints. Write for booklet, "Franklin Die-Castings in Many Fields."*

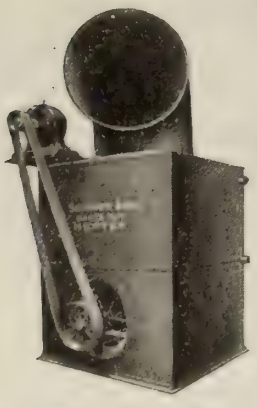
MORTON

# Increased Driving Box Repairs Forced the Purchase of this Morton Draw Cut Shaper

Delays to output were traced direct to driving box repairs in this busy shop. Time element and shortage of man power were considered and the installation of this "Morton" reflects the good judgment of these thoughtful officials to install machines of guaranteed production power.

This Morton handles all the machine work on driving boxes—planing to thickness, planing shoe and wedge faces and crowning for bearing brass. It simplifies handling and reduces machine time.

May we send Bulletin A-6 explaining numerous points of merit?



**MORTON MFG. CO.**

Muskegon Heights - Michigan

## "That Is All There Is to the Skinner Bros. (Baetz Patent) Heater—*No Pipes or Ducts*"

"As you see, it consists of a series of steam coils compactly nested over a powerful fan-wheel, and enclosed in a sheet steel casing. Cold air at the floor level (or from outside) is drawn into the heater by the fan, and forced up through and around the steam coils—after it is thus warmed, it is gently diffused through the directing elbow out into the open building space."

Steam coil type SC. Where steam is not available we supply type DF, burning coal, coke or wood. Fired like an ordinary furnace.

### Economical to Install and Operate

Skinner Bros. (Baetz Patent) Heaters are guaranteed to heat all of the open space in any large factory, foundry or plant interior. They cost 15% to 50% less to install than any other system—operating cost is equally low. They are strictly portable and require no special foundations. Use live or exhaust steam—where steam is not available, we furnish our direct-fired type DF, which burns coal, coke or wood.

Find out more about this wonderful heater—if you wish, we will send you names of users so you can investigate for yourself.

## SKINNER DRILL CHUCKS

GIVE BETTER SERVICE

Trade Mark

Skinner Drill Chucks eliminate most of the trouble of accurate drilling operations, simply because they are built right to hold the drill or tap accurately and rigidly on center. The hardened jaws are ground true.

They are easy to handle, too, as there are no exposed gears to pinch the fingers.

The long life of Skinner Drill Chucks is due to the great care with which they are built. Made of the best materials available for the purpose. All working parts hardened to resist wear, and of sufficient strength to rigidly hold the tool to the work.

**These Drill Chucks are all described in our catalogue, which will be sent to you with prices upon request.**

# IN THE STONE AGE

EVERY man was his own shoemaker and tailor, the articles he made served his purpose after a fashion, but they would not be regarded as "efficient" to-day.

Many users of Industrial Furnaces are going back to the Stone Age when they undertake to build their own furnaces.

Is it not reasonable to suppose that Engineers who have devoted the best part of their lives to the science of designing and building of better furnaces should know more about it than you do?

Many of the greatest industrial corporations in the country, who maintain large staffs of Engineers, have found it good practice to have us design and build their furnaces —such as Canadian Pacific Railway; Canadian National Railways; Steel Company of Canada, Ltd.; Canadian Tube & Iron Company, Ltd.; Crane Limited; Page Hersey Tubes Ltd.; Canada Grip Nut Co., Ltd.; B. J. Coghlin Co., Ltd.; Baldwins Canadian Steel Corporation, Ltd., etc., etc.

Ask your Competitors what we have done to help them reduce their operating costs.

Our Engineers are Experts—let us design and build your industrial Furnaces.

# Your Time Charge

## Where Minutes Are Turned Into Dollars

YOU can check with relative ease the materials you use in any product.

Time—which is more costly and more precious than the materials—is elusive and cannot be checked accurately or quickly by a manual system.

For this reason an adequate cost-keeping system can be based only on complete, reliable, mechanically-produced records of labor costs.

## International Job Time Recorders

give you an accounting of the time spent by every employee on every job—an accurate record of all **Productive** and **Non-Productive** Time. They are employed in all lines of industry, supplying data which cannot be obtained accurately or economically in any other way.

*We frequently have for sale a good line of second-hand Time Recorders from $60 upward. By buying an International you have the assurance—not merely the promise—of CONTINUED SERVICE.*

## International Business Machines Co., Limited

# Monel metal
## insures continuous machine service

WESTINGHOUSE uses Monel Metal in steam turbines as poppet valve parts and as blading because it resists corrosion and steam wear—withstands high heats—has the strength and approximately the co-efficient of expansion of steel.

These characteristics, plus the ability to resist most chemical attacks, make Monel Metal most valuable to engineers, managers and superintendents of manufacturing plants.

As indicated by the uses listed at the head of the page, Monel finds its work in special as well as in standard apparatus. It is the recognized metal for parts of valves that must handle high pressure or superheated steam, acid and alkaline solutions. It has become part of the standard specifications of the largest engineering organizations for duties where other metals have been tried but failed.

The name Monel identifies the natural nickel alloy—67% nickel, 28% copper and 5% other metals—produced by The International Nickel Company. Monel products include Monel blocks, Monel rods, Monel castings, Monel sheet, Monel wire, Monel strip stock, etc.

**Hartford, Conn.**

SHEPARD
ELECTRIC CRANES & HOISTS

# For faster foundry work

High speed production schedules are easily maintained in many foundries throughout the country by Shepard equipment.

Shepard Electric Traveling Cranes are rugged of design and built for everyday, year in, year out service — and deliver it. Operative parts, both electrical and mechanical, are contained within tight metal housings and are fully protected from dirt, dust, dampness, and fumes. Thorough lubrication is maintained by oil baths.

The wide experience of Shepard engineers in planning lifting and transfer equipment for foundries should prove helpful in laying out a system for your foundry. This service is freely extended.

*"Shepard" makes Electric Traveling Cranes, Transfer Cranes, Jib Cranes, Electric Monorail Hoists, Electric Winches and Cargo Handling Equipment for Docks and Ships.*

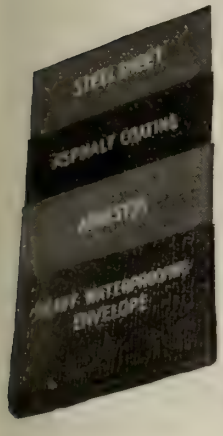
# For Permanent Replacement

*Replace the Old Roof permanently.* When you reinvest in the old building do it with a permanent material that will not need constant painting and repairs—do it with a protected metal that will *not need replacement* in a few years—do it with Robertson Process Metal.

The fact that your old roofs need replacing in so short a time proves the need for a better material. It shows how unprofitable the unprotected metal has been—how its maintenance and upkeep costs have piled up and how in the long run the investment has not been profitable.

Comparative tests between unprotected metal and Robertson Process Metal are no longer necessary. The greater value in Robertson Process Metal has been demonstrated thousands of times—by actual usage. Hundreds of times it has out-lived unprotected metal by such a wide margin that roof costs over a period of years have been more than cut in half. Hundreds of times Robertson Process Metal has replaced old roofs and siding of all kinds and put an end to wasteful corrosion losses and repair costs.

This result is to be expected when you realize how the Robertson Process scientifically protects the metal and how each sheet is completely encased, with both surfaces and edges fully protected.



In the Banker's eyes the permanent substantial building represents an equally permanent and safe investment. The quick depreciation of ordinary steel sheets in comparison with long-lived protected metal is a point not to be overlooked by bankers, investors and business men generally. They invest in "building life" and because Robertson Process Metal has a *sure future* it has found its greatest opportunity for service *in new construction.*

Besides the savings in maintenance costs, in the cost of paint and repairs, the original cost of Robertson Process Metal is less than that of any other material of equal permanency. It makes possible the employment of lighter steel frame work and more economical foundations. By its speedy construction it effects still further savings.

You will find evidence of these facts in the experience of the users listed below. The purchasing agents, the factory superintendents, the officials of these companies do not buy with their eyes shut. They are scientific buyers of building materials. Their orders give assurance that Robertson Process Metal has earned its reputation by actual tests.

Let Robertson Engineers study your building and replacement needs. Estimates together with detailed information will be gladly furnished upon request.

## *The* PRODUCT

Three impervious coatings (1) Asphalt (2) Asbestos (3) Waterproofing, stand between the metal and its many enemies. Each coat protects the other and together they perfectly shield the specially annealed steel within.

Refined Robertson asphalt forms an air-tight moisture casing first. To this protective coating a thick layer of asbestos felt is firmly bonded by powerful machinery. Because of the fibrous-rock character of asbestos it is indestructible. It cannot rot or decay. Acids and alkalies cannot affect it. The entire sheet is then enveloped and fully sealed by a thick weather-resisting coat. All metal parts of Robertson Skylights are made of R. P. M.

R. P. M. is made in corrugated, flat, beaded and mansard sheets for roofing and siding. It is also built into trim, flashing, gutters, downspouts and ventilators. Made in maroon and black.

The illustration opposite shows each step in the Robertson Process. A process sample will be gladly sent upon request—also practical literature.

## *The* EVIDENCE

This partial list of users is significant because of the prominence of the various corporations and because *all of them have used Robertson Process Metal* after careful study or because of their experience with it on previous installations.

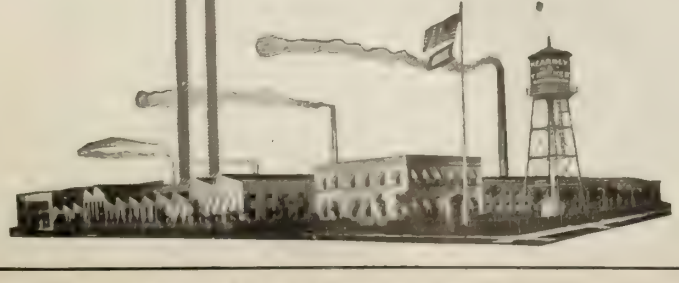
# MILWAUKEE MILLING MACHINES

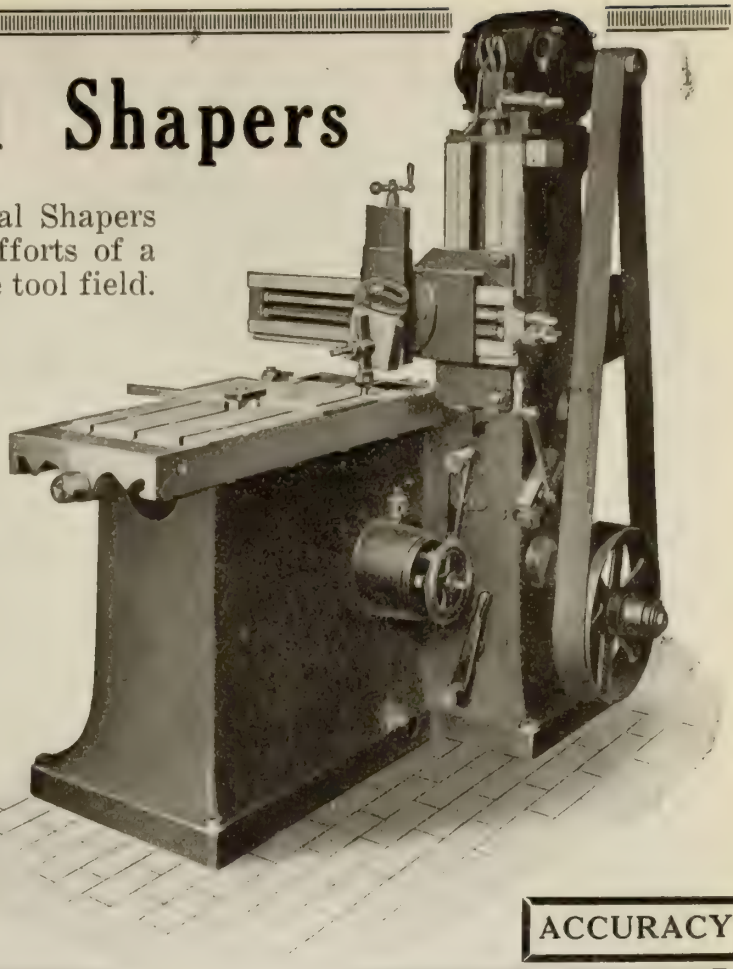


Continuous milling of 10-inch adjustable wrenches on a Milwaukee Vertical Milling Machine. These parts are turned out at the rate of 3,000 a day and the finished surface bears a constant and accurate relation to other selected points on the part.

## *Rapid, Economical Milling*

Manufacturing milling by the continuous process is an advanced step in milling machine practice that is worthy of the serious consideration of the management of any plant. The motion in this milling process is continuous. It is reasonable, therefore, that in this way maximum production is secured. This sort of milling is most desirable in the machining of parts in large quantities. The rotary table with chucking fixture holding the work revolves, and the cutter is in operation and in the work at all times. The operator removes the finished piece and puts another unmilled one in its place.

Milwaukee Vertical Milling Machines are particularly well adapted to continuous milling. The spindle is adjustable for wear only as sufficient adjustment can be obtained by the adjustment of the knee alone, the same as it is in the horizontal type milling machines.



Have you any milling that would be well adapted to continuous milling? Let us help you.

# The Norton Alundum Grinding Wheel and the Natural Grindstone

Not many years ago the old grindstone was commonly used by a great many manufacturers. To-day the same shops are using Alundum grinding wheels exclusively. Why?

The reasons are many. Here are a few of them:

1. **Uniformity.**
   Norton Alundum Wheels are made uniform by our manufacturing processes. First the Alundum grain is made by the electric furnace, which permits us to control its purity and temper. This Alundum grain is then used in making the Alundum grinding wheel by methods which result in a perfectly uniform structure.

2. **Production.**
   Because of the physical properties of the Norton Alundum Grinding Wheel and our ability to vary the grit sizes and to bond the grit to suitable hardness for each and every job the hourly production is increased.

3. **Ultimate Cost.**
   An Alundum wheel 24 or 26 x 4″ especially designed for a special operation, has done the work better than a 60 x 10″ grindstone which was formerly used. The smaller Alundum wheel gave far more total production per wheel, and lasted much longer than the grindstone. The labor saved in replacing the worn-out Alundum wheel as compared with the grindstone is an important item.

We have three different kinds of Alundum, each particularly adapted to certain kinds of grinding. The grit may be supplied in about twenty different sizes and the grade or tensile strength of the bond holding the grain together may likewise be varied.

Explain your work to us. Let us tell you what Norton Alundum wheel will be most efficient for each job.

# Surface Grinding 700 Ball Races Every Hour

## Magnetic Chucks—Their Relation to Surface Grinding—Grinding Steel Forgings, Gear Blanks, Cylinder Castings, Locomotive Crank Pin Washers, Dies, Push Rods and Connecting Rods

By J. H. MOORE

BEFORE entering into the subject of surface grinding, let us first consider the system of holding the work for such style of grinding. It is a readily conceded fact that surface grinding would never have reached its present point of efficiency but for the development of the magnetic chuck; and yet, there are quite a few mechanics who still look at you in a puzzled manner the moment you ask them, "Why don't you use a magnetic chuck?"

Of course the field of usefulness of such chucks is not confined to grinding, for they are freely used in the shop, on planer and milling operations, but as we are especially interested in the grinding field (so far as this article is concerned), let us concentrate on this particular style of work.

Luckily, the magnetic chuck has been developed to such a point that it has literally forced itself upon industry in general. Its usefulness has been proven beyond a doubt, and results obtained have been so satisfactory that many industries could hardly get along without them. In spite of this, the chuck itself still remains to the men who use it daily a tool of mysterious holding power. Many tool makers, who ought to know better, still persist in the belief that such a chuck can hold flat pieces only, but for irregular shaped parts,—well to put it bluntly, they revert back to the vise. This is hardly fair to the chuck itself, or the principles involved, so without going too far into detail, let us ask the question, "What is a magnetic chuck?"

First of all, it is a device that will hold magnetically various shapes of work while machining operations are being performed. It is a labor and time saving factor that is rapidly proving its wide field of usefulness, and is being used not only in the tool room and machine shops, but in manufacturing trades in general.

These chucks were originally designed to hold only flat pieces on which very light operations were performed. At that time they were considered merely as time saving factors in the tool room, and truth to state, were looked upon as rather risky factors at that. Development is a great thing, however, and now, when we speak of magnetic chucks, we refer to devices that will hold pieces of magnetic metal of almost any shape, this including even rough castings and forgings. We also know that the modern magnetic chuck is a device magnetically strong enough to hold pieces securely against the heavy strains that are brought to bear upon them by our modern production methods.

Such chucks are no longer accessories, they are essentials, and a surface grinder, especially if used for production work, has a magnetic chuck as part of its equipment.

Of course, if such a chuck is used in manufacturing work, a sufficient number of duplicate pieces have to be passing through the shop to warrant the expense of special holding fixtures, that is, if the parts are of irregular shape. As surface grinders are to a large extent used on such work, the first cost of the holding fixture is nothing compared to the saving which results through its use.

To go into the various styles of chucks on the market would take a volume in itself. We are not so interested in the various makes, however, as we are in the

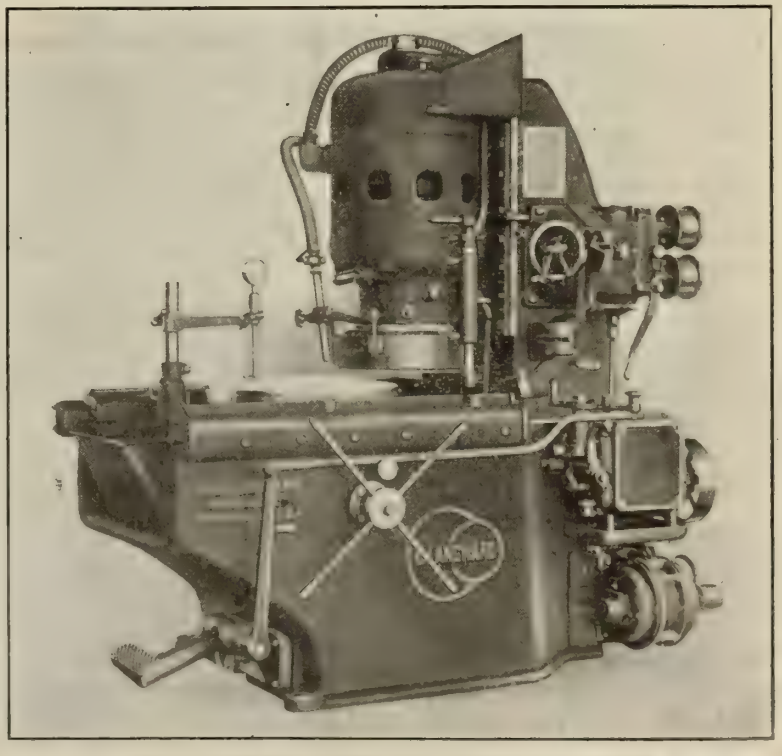

FIG. 1—GENERAL VIEW OF A SURFACE GRINDER.

FIG. 2—A MISCELLANEOUS ASSORTMENT OF PARTS FINISHED BY SURFACE GRINDING.

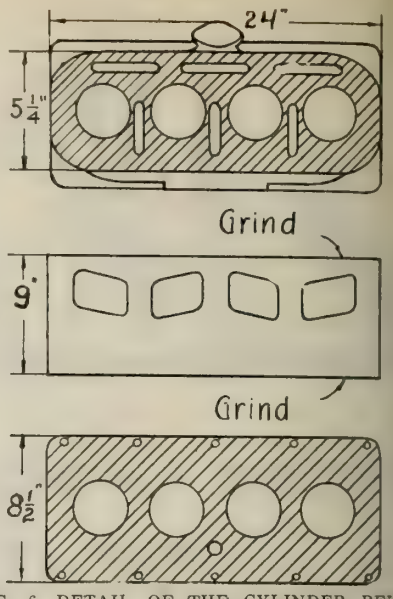

FIG. 6—DETAIL OF THE CYLINDER BEING GROUND AT FIG. 5.

work that they can accomplish, so feeling sure the shop superintendent, and mechanics in general, do not care to delve into the principles of magnetism, we will simply show how magnetic chucks have helped the cause of surface grinding.

Before proceeding to examples of work performed, let us discuss in a brief manner the term "surface grinding." This term in the minds of many shop men means finish-grinding, or grinding preliminary to lapping such work as dies, tools, gauges, small hardened parts, etc. This conception of the term was at one time quite correct, for the first style of surface grinder was intended for such work. These machines were used for the removal of a small amount of stock, usually hardened steel, and some of the machines were adapted for dry grinding only.

Times have changed, and now when we speak of surface grinding, we refer to the removal of stock at a high production rate. Grinding machines have of course been developed to a high point of efficiency to handle such work, and through the courtesy of the Blanchard Machine Co., Cambridge, Mass., we are able to present various examples of work produced by their practice. These examples are picked at random, and illustrate in a general way the wide field of usefulness of this style of grinding. A word about the machine itself.

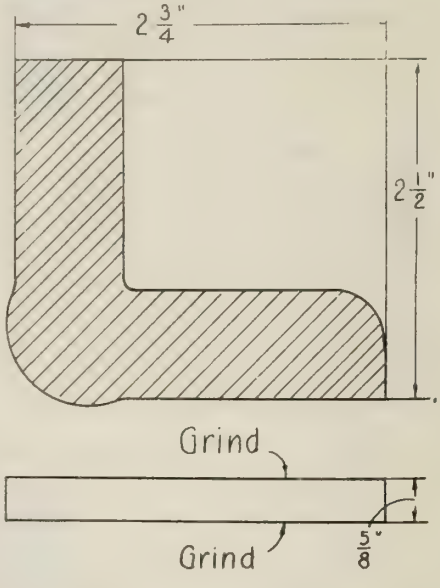

FIG. 4—DETAIL OF THE FORGING BEING GROUND AT FIG. 3.

Fig. 1 depicts a No. 16 Blanchard vertical surface grinder with a direct motor drive. Without going into the constructional details, enough to say that the machine consists of a spindle, a suitable mounting for the spindle, a wheel, a table with a magnetic chuck, and various gear changes necessary to obtain the different speeds. Our chief reason for confining the details to this brief space is that anyone interested can write for further information, while by holding down the constructional details in this manner we can proceed with the work accomplished which, after all, is the foreman's chief consideration.

### Method of Procedure

The work to be ground is laid on the rotary magnetic chuck, and the switch closed. The entire table, comprising the chuck and the sliding carriage in which it and its driving mechanism are mounted is then moved by hand horizontally on the base to bring the center of the chuck just under the face of the cylinder wheel. In this position the chuck is rotated continuously. The water to inside of wheel is turned on, after which the wheel head is gradually fed downward, usually .001 inch to .002 inch per revolution of the work, until the desired size of work is reached. The wheel head is then raised enough so that the wheel will clear

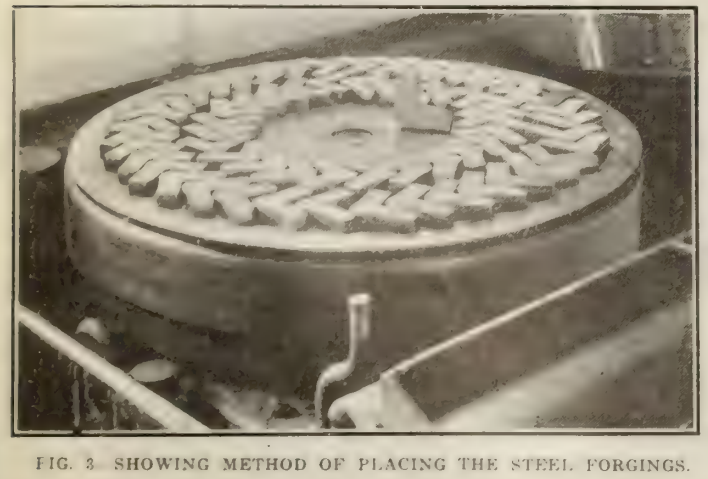

FIG. 3—SHOWING METHOD OF PLACING THE STEEL FORGINGS.

FIG. 5—GRINDING CYLINDER CASTINGS IN AUTOMOBILE PLA

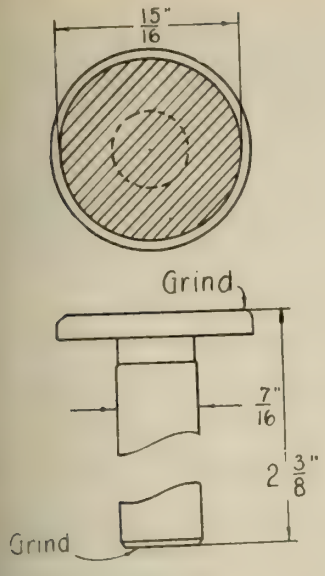

FIG. 8—DETAIL OF THE PUSH ROD.

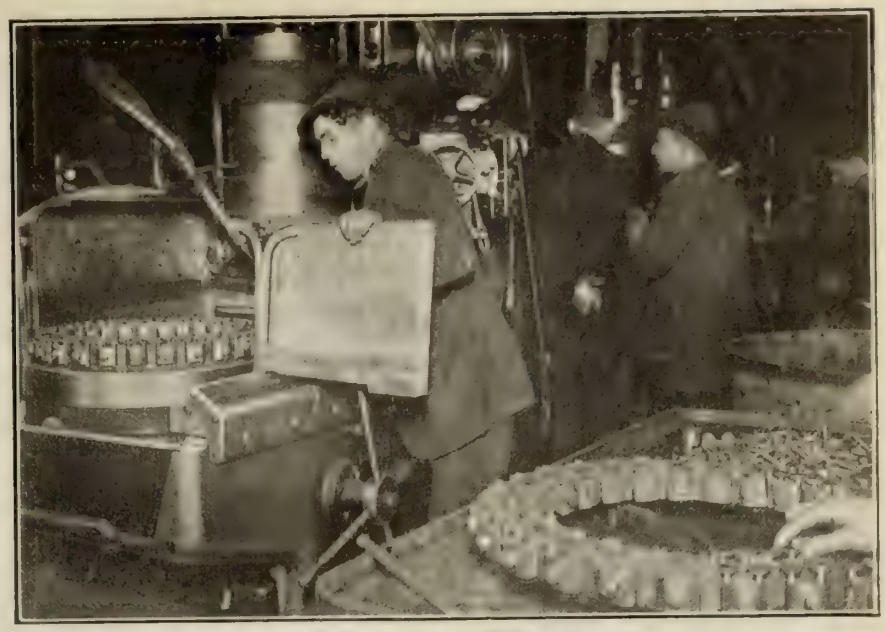

FIG. 7—GRINDING AUTOMOBILE PUSH RODS.

ext load of rough pieces, the chuck ro- ation is stopped, the chuck is moved orizontally out from under the wheel, nd the finished work removed. Should he pieces have to be ground on both ides, they are reloaded the other side p, and again ground in similar manner. Should the parts be ground on one side nly, the pieces are removed and fresh arts placed on the fixture or chuck. This, briefly, is the procedure adopted.

The wheels used differ in grade de- ending upon the nature of the work, but n every case, irrespective of the parts eing ground, the wheel is a plain hollow ing of abrasive, mounted in a cast iron ing. It is left in this ring until worn ut. We do not wish to take up further pace on the machine itself, so leave eaders to study Fig. 1 at their leisure.

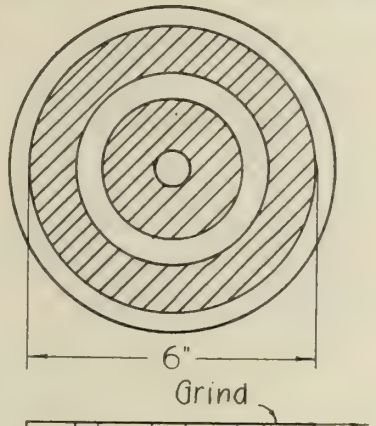

FIG. 10—DETAIL OF ARMATURE DIE.

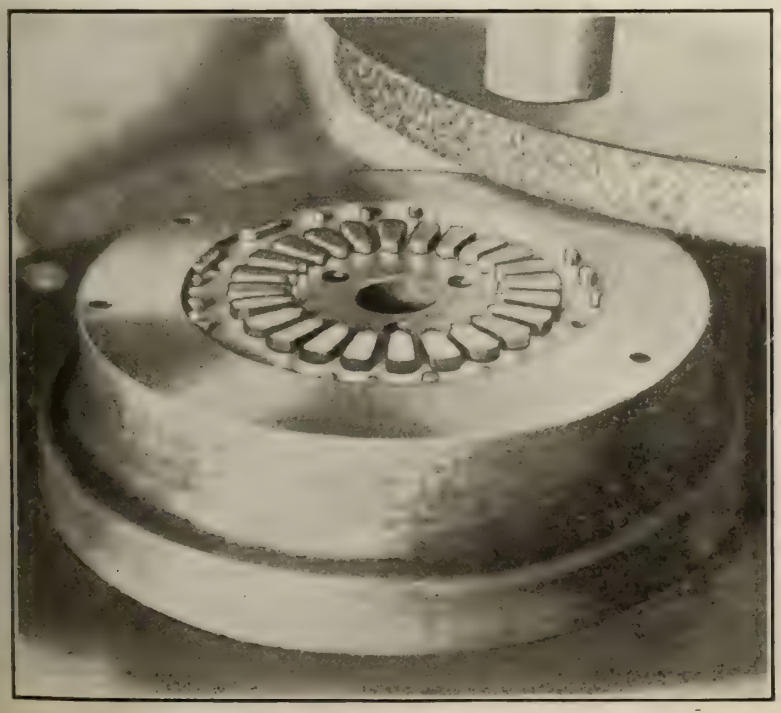

FIG. 9—GRINDING AN ARMATURE DIE.

In the meantime let us consider examples of work produced.

### Examples of Work

Referring to Fig. 2, we see a miscellaneous group of parts machined by surface grinding. There is no need to speak on the variety of work shown in the photograph for it speaks for itself. Our main reason in showing such a group is to bring up the question, "What field is covered by surface grinding?" The extreme range of work possible to machine by this process makes it difficult to define the field, but generally speaking it is a process that will machine almost any flat surface unobstructed by projections. As the boosters of the method put it, "A process that obtains a finish and accuracy somewhat better than would result from a roughing cut made simply to remove metal." The field is constantly growing, new uses and applications being discovered daily.

Figs. 3 and 4 depict both the photographic and diagrammatic views of a steel forging, this piece being ground on a machine of the same size shown at Fig. 1; a 26 inch magnetic chuck being used. The stock removed per side is 1-16 inch, and the work is held to limits of plus or minus .0005 inch. As can be noted, the piece is ground on both sides, and the production on this forging is 326 surfaces, or 163 pieces per hour. This production was obtained without any special equipment, and proved to be a great saving on the previous method employed.

Figs. 5 and 6 depict the grinding of cylinder castings in a certain automotive plant. The same equipment, stated above, is used, and the piece itself, made from cast iron, weighs 90 pounds. The stock removed per side is from .015 inch to .020 inch, and the limits are plus and minus .003 inch. Two sides are ground, and the production is 32 surfaces or 16 pieces per hour. This figure is of course for one machine. These parts are rough

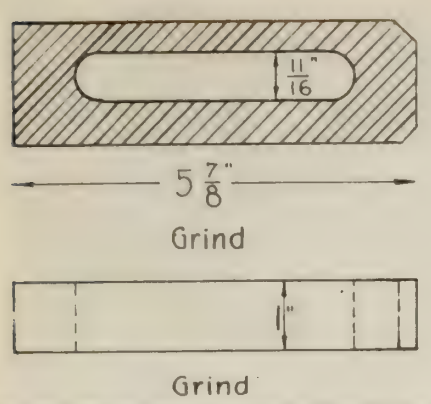

FIG. 12—DETAIL OF THE STEADY REST JAW.

milled before grinding, and the object of thus grinding is to give the part proper finish, accurate height, and at the same time making it easy to secure tight joints without using thick gaskets.

Figs. 7 and 8 illustrate the grinding of automobile push rods. The material is hardened steel, and the stock removed per side .015 inch. The limits are held to plus or minus .001 inch, and two sides are ground. The production is some 1,600 surfaces or over 800 pieces per hour. These rods have to be ground on both ends, to length, square with the shank. Fixtures are used which hold 104 rods each, the rods being clamped in V grooves, one bolt gripping four rods, two on the outside, and two on the inside. Three machines, six fixtures, and six men produce 2,500 rods per hour. This is not the highest possible figure, but is taken from an average production day.

Figs. 9 and 10 depict the grinding of an armature die. The material is of course hardened steel, .015 inch of stock per side being removed. No limits are necessary, the main stipulation being to clean up. The complete grinding of such a die occupies only four minutes.

### Further Examples

Figs. 11 and 12 illustrate the grinding of some steady rest jaws, these being made of cast iron. The stock removed is 1-32 inch per side, and the work is held to plus or minus .0015 inch. Four sides are ground, and the production time is 100 surfaces or 25 jaws per hour. These

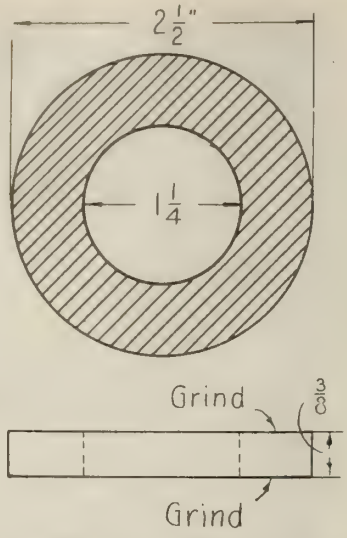

FIG. 14—DETAIL OF THE PACKING RING.

jaws must be parallel and square and are finished from the rough. The two parallel sides, viz., the operation shown

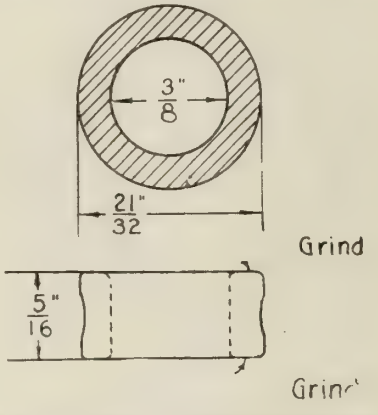

FIG. 18.—DETAIL OF THE BALL RACE.

in photograph, is done at the rate of 120 surfaces per hour. The pieces are then packed between square bars, or clamped

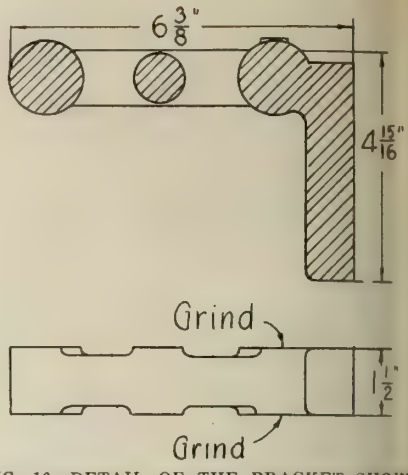

FIG. 16—DETAIL OF THE BRACKET SHOW AT FIG. 15.

against vertical surfaces of a block, ar one edge ground square with the tw parallel sides. They are last of all place with this squared edge on the chuck, ar the second edge ground parallel to it.

Figs. 13 and 14 depict the grinding some cast iron packing rings, the stoc per side removed being 1-64 inch wi limits of plus or minus .001 inch. Tw sides are ground, the production beir 270 surfaces or 135 rings per hour. Th work is done on a smaller sized machi than those previous.

At Figs. 15 and 16 is shown the m chining of cast iron brackets, the stoc per side removed being 1-16 inch. Tl limits are held to plus or minus .001 inc and two sides are ground. The produ tion is 90 surfaces or 45 parts per hou

A very interesting example of sma work is shown at Figs. 17 and 18. The parts are hardened steel ball races a .007 inch stock per side is removed. T pieces are held to limits of plus or min .005 inch, and two sides are ground. T production is 1,400 surfaces, or 7

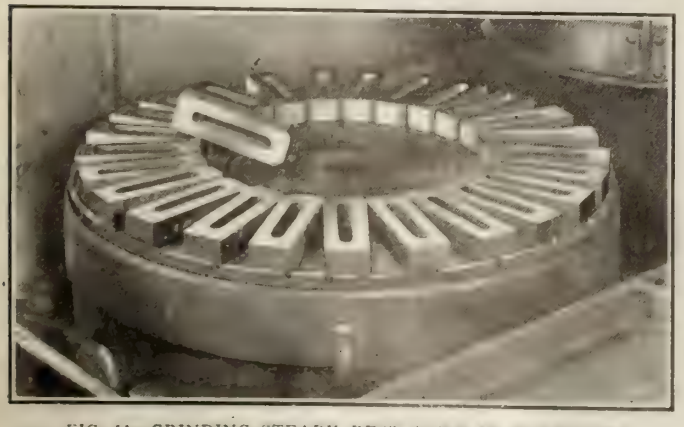

FIG. 11—GRINDING STEADY REST JAWS IN QUANTITY.

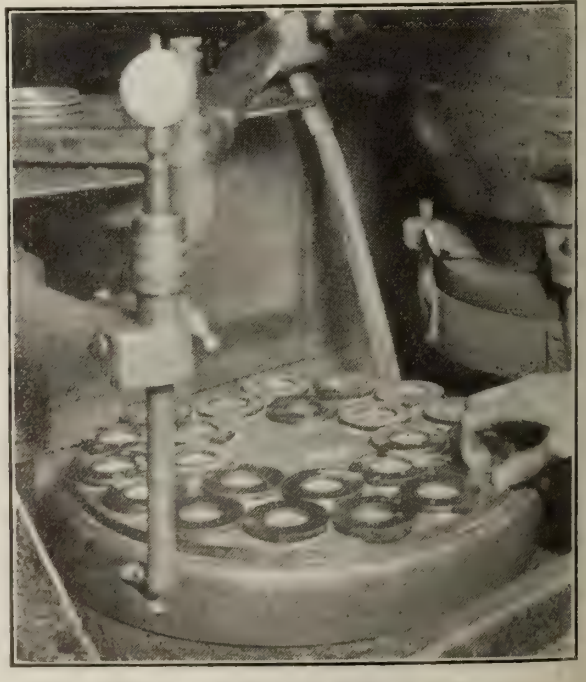

FIG. 13—GRINDING PACKING RINGS.

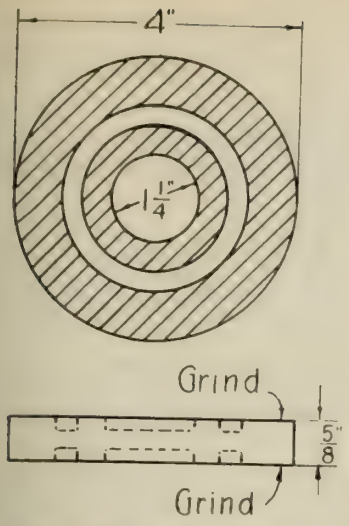

FIG. 19 - DETAIL OF A GEAR BLANK GROUND.

races per hour. This production is for one man only operating the machine. A man with a helper operating the machine and using plates for loading and a rapid washing device (the helper loading the plate while the machine is grinding) produces 3,600 pieces per hour. In the illustration the work is retained by inner and outer rings, this being the standard method of chucking small pieces.

### Diagrammatic Views

The remaining illustrations will be confined to drawings only. Fig. 29 depicts a gear blank made from soft alloy steel, 1-16 inch stock per side being removed. The work is held to limits of plus or minus .001 inch, and the blanks must be parallel to within .005 inch; 150 per hour is the production figure.

Fig. 20 depicts a locomotive crank pin washer 7¾ inches outside diameter made from hardened steel. Both sides of this washer are ground, .032 inch being removed from each side. The work is held to limits of plus or minus .005 inch, and 180 surfaces, or 90 complete washers are completed per hour. This is only one example of locomotive work, but such parts as slide valves, piston rings, link plates, ball couplings, link blocks, main links, radius rods, guide liners, wedges, main rod keys, etc., have been machined by this process with splendid success.

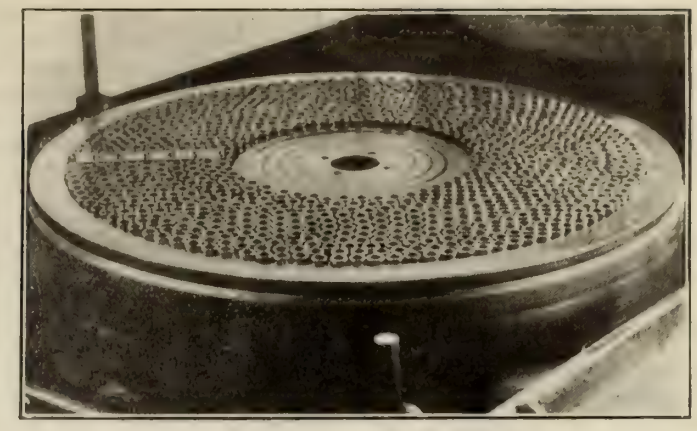

FIG. 17—GRINDING BALL RACES.

Fig. 21 shows a rather good example of die grinding, this being a crankshaft forging die. The material is hardened steel, and .012 inch is removed. The die has merely to be cleared up and the grinding takes only 10 minutes.

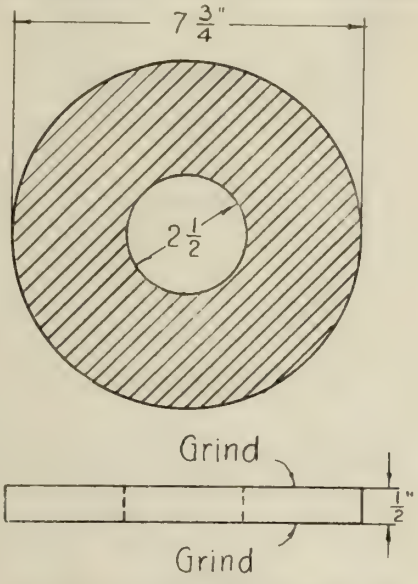

FIG. 20—A LOCOMOTIVE CRANK PIN WASHER THAT IS GROUND.

The gear box shown at Fig. 22 is made of cast iron, ⅛ inch of stock being removed. No limits are given, the work being merely cleaned up. Of course, a special fixture is necessary, but the design is lighter and the cost less in this case than it would be for a milling or planing fixture. The parts need not be clamped, unless there is a tendency to tip, and then only a very light form of clamping is necessary. Six pieces per hour is the production figure on this particular work.

Fig. 23 shows a connecting rod made from a steel forging that lends itself nicely to grinding. The points ground are shown in sketch, .050 inch stock being removed per side. The work is held to plus or minus .001 inch, and the production per hour is 216 surfaces, or 54 rods per hour.

As the surfaces of the large and small ends of these rods are not at the same level, they are chucked in approximately radial position with the thick ends toward the center of the chuck. After grinding these ends, the chuck is moved out until they clear the wheel, when the wheel is then brought down to grind the thin, small ends. Of course the same procedure is adopted when the rods are turned over in the fixture.

The last example, that at Fig. 24, depicts a reamer blade ground on a No. 10 grinder, using a 16 inch chuck. The material is hardened steel, the stock removed per side being .020 inch. The work is held to limits of plus or minus .0005 inch and, as can be noted, two sides are ground; 660 surfaces, or 330 blades per hour are produced.

We could go on indefinitely illustrating examples of work completed by surface grinding, but sufficient has been shown to not only prove the effectiveness of the process, but its wide scope.

Before leaving the subject, however, let us dwell on a few points of general interest. Speaking on this method of grinding, the Blanchard Co. have the following to say:

It is obvious that to obtain a succession of light cuts economically it is necessary to have a high work speed. This is readily obtained on a rotary chuck type of surface grinder, because the chuck revolves continuously in one direc-

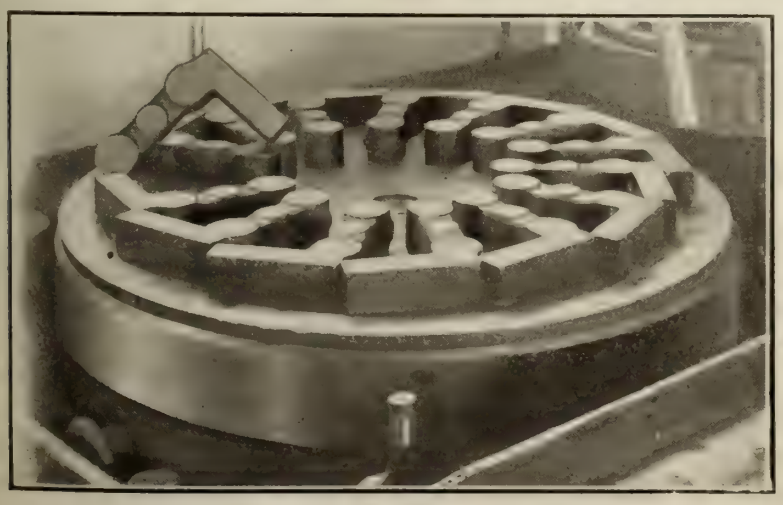

FIG. 15—GRINDING SOME CAST IRON BRACKETS.

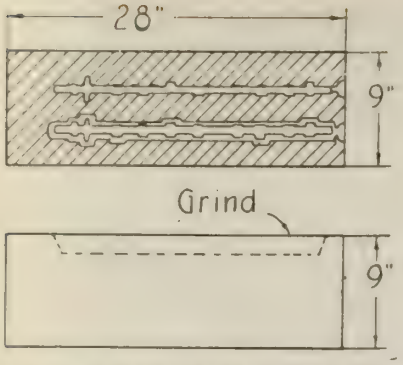

FIG. 21 A CAMSHAFT FORGING DIE, GROUND WITH SUCCESS.

tion and there is no need for any reversing mechanism such as is used on planer type machines. To rotate the chuck say at 28 r.p.m. (which corresponds to 140 feet per minute) requires no elaborate mechanism, and the action of the wheel when fed .001 inch 28 times a minute is much better than when it is fed .005 inch five times a minute. Furthermore, a high work speed greatly facilitates keeping the work cool, for it reduces the time that any particular point on the work remains under the wheel. When a broad surface is being ground, the work under the wheel is difficult to reach with any large volume of coolant, while that out of contact with the wheel is readily supplied.

### Coolant System

For accuracy on any work, and to permit rapid grinding of hardened material, the work must be kept cool at all times. If work is ground dry, the grinding must be done slowly so that the heat generated may be carried away by the parts of the machine and the surrounding air. Therefore on our system all grinding of metal is done wet. This means more than merely flooding the work with water after it comes out from under the wheel, for to heat the work and then suddenly cool it is perhaps worse than letting it remain hot. The water system applies the water where the heat is generated—between the wheel and the work—and absorbs it before the work can become heated. Water is supplied by a one-inch pipe to a passage in the wheel head from which it enters the faceplate carrying the wheel. In the passages of this faceplate it is whirled at the full speed of the wheel and issues from under the cutting face of the wheel with force sufficient to carry it between the wheel and the work in considerable volume. To increase the cooling available on broad surfaces, an auxiliary nozzle is used which floods the work clear of the wheel. The base of the machine serves as the tank for the water and holds 65 gallons. The water passes from this main tank through a removable gate that holds back both the mud at the bottom and any floating dirt into the pump tank at the rear. There a submerged centrifugal pump forces the water to the wheel head and to the outside nozzle. It is interesting to note that the most satisfactory results have been obtained by the use of a solution of seven pounds of soda ash in fifty gallons of water. To this, when grinding steel, one or two quarts of cutting oil may be added, but on cast iron it is advisable to use only the soda and water. Numerous grinding compounds have been tried, but have been unsatisfactory for one or more of the following reasons:

1. They foam so as to overflow the tank. 2. Are opaque and prevent operator from seeing work. 3. They prevent good wheel action on hardened steel. 4. They mix with cast iron chips and form a paste. It should be remembered in this connection that the wheel contact on a surface grinder is very high, being sometimes as great as 25 square inches.

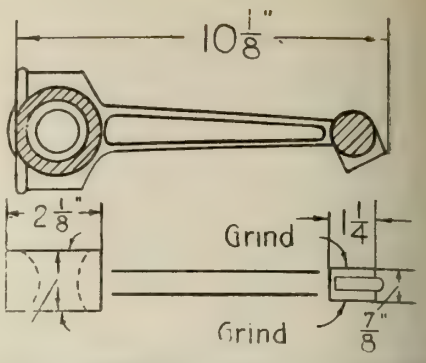

FIG. 23—CONNECTING RODS CAN BE GROUND VERY READILY, AS CAN BE NOTED FROM THIS SKETCH.

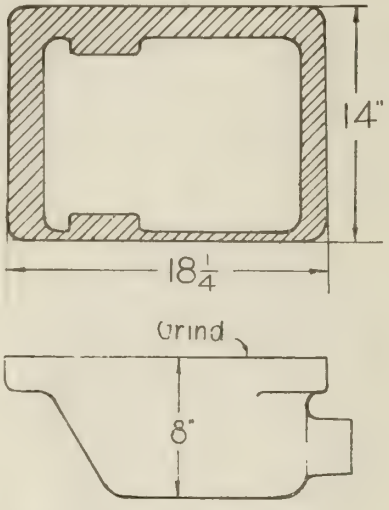

FIG. 22—A GEAR BOX GROUND BY THE SURFACE METHOD.

### The Chuck

Next to the spindle, the chuck is probably the most vital part of a surface

| Material | Width of Surface | Finish and Narrower Surfaces | Best Wheel for Average Work | Faster Cutting and Broader Surfaces | Finer Finish and Narrower Surfaces | Best Wheel for Average Work | Faster Cutting and Broader Surfaces |

TABLE NO. 1—WHEELS WHICH HAVE BEEN USED WITH GOOD SUCCESS.

### THE ECONOMY OF USING SOFT, FREE-CUTTING WHEELS

| Data:— | Hard Wheel | Soft Wheel |
|---|---|---|
| Production per hour | 150 pcs. | 200 pcs. |
| Life of wheel | 75 hrs. | 50 hrs. |
| No. of pieces ground by one wheel | 11250 pcs. | 10000 pcs. |
| Example 1—Taking labor at 55c, burden 100% or 55c | | |
| | Costs per 1,000 pieces ground | |
| Wheel cost at $20 per wheel | $1.78 | $2.00 |
| Labor one man at 55c per hour | 3.66 | 2.75 |
| Burden at 55c per hour | 3.66 | 2.75 |
| Total, per 1,000 pieces | $9.10 | $7.50 |
| Saving, by using soft wheel | $1.60 per 1,000 pcs. | |
| | $2.88 per day, 9 hrs. | |
| | $864.00 per year, one shift. | |
| Example 2—Taking labor at 75c, burden 166% or $1.25 | | |
| | Costs per 1,000 pieces ground | |
| Wheel cost at $20 per wheel | $1.78 | $2.00 |
| Labor one man at 75c per hour | 5.00 | 3.75 |
| Burden at $1.25 per hour | 8.34 | 6.25 |
| Total, per 1,000 pieces | $15.12 | $12.00 |
| Saving, by using soft wheel | $3.12 per 1,000 pcs. | |
| | $5.62 per day, 9 hours. | |
| | $1,686.00 per year, one shift. | |

TABLE NO. 2—SHOWING THE SAVING EFFECTED BY USING SOFT, FREE-CUTTING WHEELS.

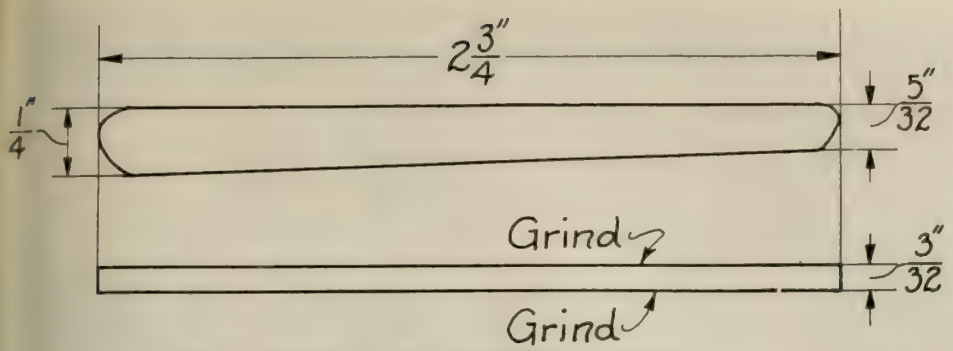

FIG. 24—REAMER BLADE SUCCESSFULLY GROUND.

grinder. The chuck bodies on our machines are made from a solid disc of forged steel in which are machined on one side large concentric grooves to receive the coils, and on the other side numerous small grooves which are later filled with hard brass strip. This leaves a continuous layer of steel extending under the entire face of the chuck, making leakage of water into the coils an absolute impossibility. The coils are form wound, vacuum impregnated, and are sealed in place with an insulating compound, making the completed chuck solid, with no air spaces. This eliminates trouble from sweating and does away with the need for ventilation of the chuck.

The working face is composed of steel and brass in alternate rings. So close is the spacing of the steel poles that a piece of work as small as a 25-cent piece will touch two or more poles, no matter where placed. The chuck will hold large or small pieces equally well, and once ground true will remain much longer in this condition than chucks having cast-iron and soft metal in the face. Also the annoyance due to grit charging the soft metal and making bad scratches on the work cannot occur when the chuck is of the construction spoken of. Owing to the close spacing of poles, it is not necessary to provide perforated plates for locating any but the smallest work.

### Wheels Used

Little has been said up to the present concerning the grinding wheels used, beyond indicating that the soft, free-cutting wheel is the most satisfactory. Not only is a soft wheel satisfactory from the viewpoint of the production manager but it is the most economical wheel when studied from the desk of the cost accountant. The first reason for satisfaction with a soft wheel may be explained in this manner:

Any one grain of abrasive in the grinding wheel should cut until it loses its cutting edge, and then it should either fracture and present a new edge, or be torn from the wheel by the increased friction due to its dull edge. If the bond of the wheel is so strong that the grain must get exceedingly dull before it is dislodged (i.e., if the wheel is hard) much power is absorbed in useless friction, for the grain rubs but does not cut. These dull grains not only waste power but their presence reduces the number of effective grains in the wheel face, and so reduces the rate at which metal can be removed from the work.

Considering this same subject from the cost standpoint, let us show some figures in table No. 1 gathered from an actual machine operation to prove the point.

It should be remembered that this is not the most striking case of the economy of free-cutting wheels, but is an average example, also that in a wheel which is altogether too soft the grains are torn out before they become dull and are thus wasted. At table No. 2 is shown a tabulated list of the grains and grades of the wheels which we have found satisfactory on certain work.

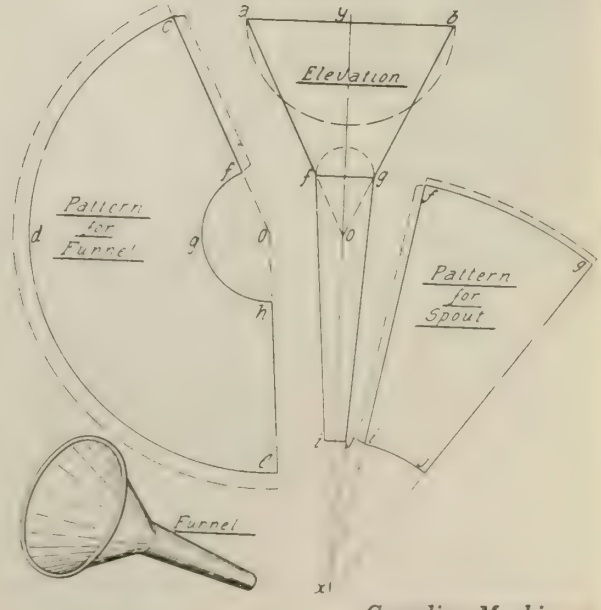
### ORGANIZED MOTORING

As an example of the degree to which motoring in Great Britain has been organized—wholly by private enterprise—the "sentry boxes" instituted at various points along the main country roads by the automobile association are very striking. The sentries on duty at these boxes provide information on routes, road conditions, hotels, and so on, to motorists, and they are also available to assist in repairing breakdowns or in securing relief cars with the utmost promptitude. The boxes are provided with telephones. A short time ago the members of the association were provided with keys to enable them to open the boxes and use the telephones during the hours when the sentries were not on duty. The latest development is to illuminate each box so that its position may be readily discovered after dark.

In a certain plant, where polishing is a major operation, a special work bench of grated construction is used. Not only is the polishing completed on this bench, but the dust is immediately drawn down through the grating. The air is perfectly clear, thus the bench serves a double purpose.

# *Sheet Metal Work*

## *Development of Funnel and Spout*



Sketch shows elevation (centre) and the developed patterns for the funnel (left) and the spout (right).

The elevation, giving the necessary dimensions is first drawn, using the centre line X Y as a base. The sides are prolonged until they cut the centre line at O and X. With O as a centre and radius O A, describe the arc C D E, also the arc F G H, the latter with a radius F G. Make the arc C D E equal to the circumference of the mouth of the funnel and complete the pattern by drawing the necessary radii at each end.

The spout pattern is developed in the same way, using X as a centre with the radii as shown.

For wiring and seaming purposes additional metal is added, as indicated by the dotted lines.

If dies are to be made for punching out the blanks, it is well to make a few samples by hand before deciding on the final shape.

# Manufacturing a Lightning Mixer and Beater

## Production Methods Must Be As Low As Possible—Various Dies Used Including Blanking and Forming—Depressing and Trimming, Also Piercing and Marking—Effective Twisting Fixture

By ROBERT MAWSON

IT is a well-known fact that to make a household necessity a success the price must be as low as possible. This in turn means that the production methods must be as economical as pos sible for otherwise the price could not be kept down.

The article to follow describes the operations followed out in manufacturing a certain kitchen convenience, known as the Roberts lightning mixer and beater. According to the maker's claims, it can be used to beat eggs, whip cream, mix mayonnaise, churn butter and other such tasks. However, we are not so much interested in its qualities as we are in the method of its manufacture. In order, however, that readers can form some idea of its general appearance we show the device at Fig. 2.

### Actual Operations

Fig. 2 depicts the punch and die employed to blank and form the cover. The punch B is made with a similar contour to that of the cover and is held by means of a shank in the ram of the punch press. The die is held rigidly on the table of the machine with two bolts fitting in the slots of the base. The strip steel is fed between the punch and die and, as the former descends, the material is blanked out. The outside diameter of the punch is a good sliding fit inside the steel ring of the die B, this accounting for the operation. As the punch continues to descend, the blank is formed between the hollow portion of the punch and the sliding plunger D of the die.

This plunger has a shank which passes through the base of the die and is held so that it cannot come out with nuts. Between these nuts and the large diameter of the plunger are placed a series of rubber discs. As the punch is fed down, the blank is formed, the rubber discs being compressed, but as the punch returns these discs resume their original thickness and raise the plunger D. This in turn forces the blanked and formed cover out of the die so that it can be easily removed by the operator. One of the covers after the operation described is illustrated at E.

The cover is then placed on the die, Fig. 3, being located by means of the four stops A, and the next operation of forming depression and trimming is performed.

The punch B is held in the ram of press in the usual manner, and, as it is fed down, it first trims off the outside edge. The machine in which this operation is performed is of the double acting type, and the second stroke forces down the ram or former C, thus making the depression in the cover.

The punch is also provided with a cutting tool D, which slits the portion of the cover trimmed off, and as these slit sections build up on the punch they automatically fall away from the tool, or, if need be, can be easily removed by the operator.

The illustration, Fig. 4, shows the tools for piercing the centre hole and marking. The cover A is placed on the die after it has been fastened securely on the table of the press, and the punch attached in the machine ram. The punch is then fed down and the hole pierced and the letters formed on the cover as shown by the sample A. This completes the operations on the cover.

The first operation when making the dasher is blanking and punching the holes, and the tools employed are illustrated in Fig. 5. The strip is fed over the die A, which is held in a bolster on the punch-press table. It will be noticed that the various piercing tools used are

FIG. 1—COMPLETED ARTICLE

FIG. 8—FIXTURE FOR TWISTING THE STEM.

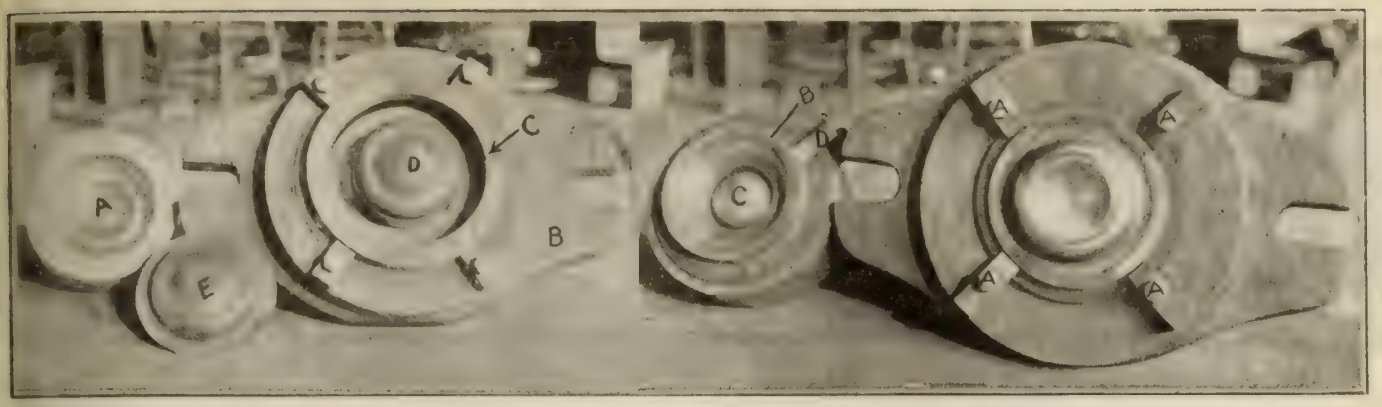

FIG. 2.—BLANKING AND FORMING COVER.

FIG. 3.—FORMING DEPRESSION AND TRIMMING.

arried in the die, the cross-shaped sec-on being made a sliding fit in the die nd operated by rubber pads as pre-iously described.

The punch is then fed down and it rst blanks out the dasher, and, as this pushed down with the continued troke, the holes are then punched out y means of stationary tools in the die. he stripper plate C is held between the unch and die and removes the part as he punch is drawn back with the ma-pression shown in the centre of the dasher C. The tools are held in the machine in a similar manner to that already described.

When making the stem the material is purchased in a rectangular form of the proper dimensions and is fed into the die shown at Fig. 7 against the stop B, which is made adjustable so that this tool may be used for making stems for both the pint and quart sizes.

The punch C is then fed down with However, the duty that it has to perform is only light and it answers the purpose very well.

The dasher is first riveted on to the stem, using a standard machine for the work. This is then placed into the fixture with the dasher resting against the end A. The headless set screw B is next tightened to hold the stem rigidly.

The free end of the stem sets into a slotted portion of the chuck C, the handle D is then given two and a half

FIG. 4—PUNCHING HOLE AND STAMPING.

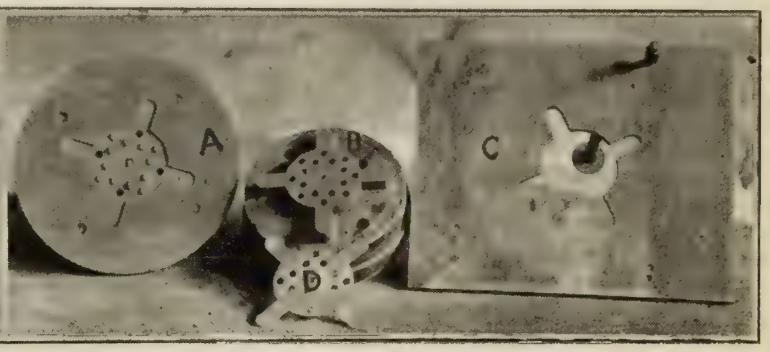

FIG. 5—BLANKING AND PIERCING DASHER.

ne. One of the dashers after going rough these operations is shown at D.

**Forming Depression**

The part is now ready for the next peration, which is bending prongs and rming depression, and the tools used e shown in Fig. 6. The blank is laced in die A and the punch B fed own with the press. This action first ends back the prongs, and the con-nuation of the stroke makes the de-the press and the strip stock is cut and one end blanked with a short cut away portion as D and the strip which has been cut to length made with a long portion as E. By this method the punch forms the beginning of one stem and completes another stem in one operation.

A somewhat crude tool is used for the next operation, which is twisting the stem, and is illustrated in Fig. 8. revolutions, and, as the handle comes in contact with the driver E, the stem is twisted to the shape shown by the sample F.

The twisted stem is next placed through the slot in the cover and a porcelain knob riveted on. The various parts now assume the condition of the finished work and only require placing on to one of the glass containers when the device is ready for service.

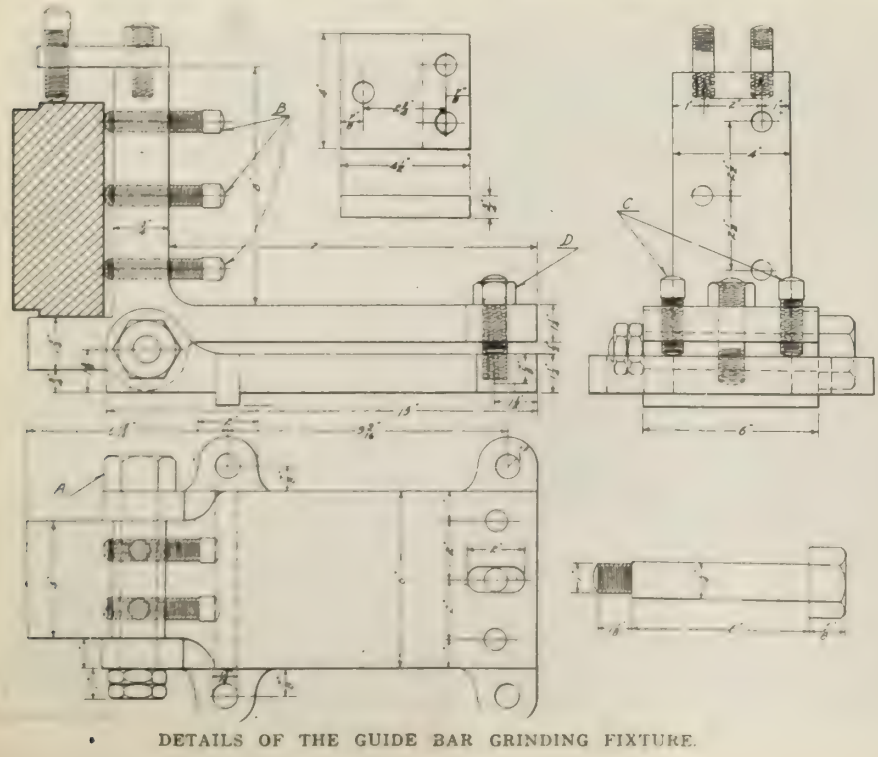
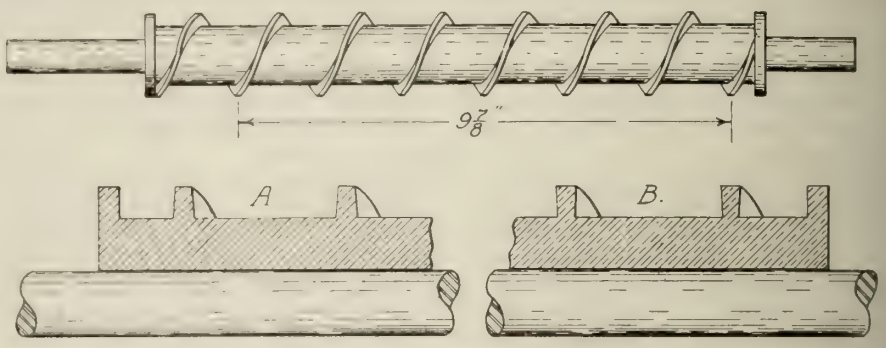
# WHAT OUR READERS THINK AND DO



## GRINDING LOCOMOTIVE GUIDE BARS.

By F. C. H.



The jig as shown was designed to facilitate the grinding of locomotive repair guide bars. It is the practice, at least it is our practice, to remove as little as possible from the wearing face of the bar. To accomplish this it is often necessary to throw the bar out of line, or out of square, with the other machined surfaces of the guide bar, to square the wearing face with the grinding wheel.

These guide bars were previously secured to table with ordinary clamps, bolts and packing, and to make the necessary adjustment to square wearing face of bar to wheel it necessitated the slacking off of bolts and clamps at each adjustment, often requiring several trials before final adjustment was made. With the aid of these jigs, of which there are two, each being composed of a base secured to machine table, the one which holds the bar being attached to the base by knuckle pin A, the time required to set bars was reduced considerably.

The guide bar is placed in jigs as shown, set pins B allow the guide bar to be moved towards wheel at either end to bring same in alignment with wheel, while set pins C allow guide bar to be set over or tilted to square the wearing face of bar with the wheel. The nut on stud D is tightened after each adjustment.

DETAILS OF THE GUIDE BAR GRINDING FIXTURE.

WE DESIRE AS MANY REPLIES AS POSSIBLE ON THIS SCREW CUTTING QUERY.

## SCREW CUTTING QUERY

By J. H. R.

The sketch herewith shows a brass roll cast upon a steel shaft. These rolls were intended for use on a corn husker, and it was required to insert a strip of rubber between the helical rib throughout the entire length. As the casting came from the foundry the rib had a slight draft as shown at (A), but in order to provide a better grip for the rubber, it was decided to under cut the rib as at (B).

After measuring up the pitch of the rough casting it was found that this was approximately six turns in 9⅞ inches. This was a pitch of 1.6458 inches. On a lathe with a four thread lead screw, and a range of change gears from 20 to 80 (advancing by 5), including one of 69 teeth, what gears would be best suited for facing off the sides of the rib? If a new gear had to be made, what number of teeth would give the greatest accuracy?

Replies from readers on the solution of this problem—or any of similar character—would be appreciated.—Editor.

### COLOR VERSUS HARDNESS

Quite often a workman spends considerable time in carefully drawing the temper of a piece of carbon steel, only to find to his dismay that it is soft, while yet the color is real light brown! It upsets his ideas of steel and hardening. Really, the trouble is that the piece was not hard when taken from the water. Either it was not hot enough to harden when dipped, or else it was removed from the bath too soon and drew itself before the black was polished off. Test the piece as soon as taken out of the hardening bath—it is quite apt to prove soft. Remember that the same colors can be produced on a piece of mild steel but they do not indicate a state of hardness.

## GRINDING AUTOMOBILE DRIVE GEARS

By A. J. QUINLAN

The drawing herewith illustrates a neat method of setting and holding a drive gear in a Heald, or other internal grinding machine, when grinding the bore. The finished bore must be concentric with the pitch circumference of the teeth, and as the teeth are cut with the blank held on an arbor cloely fitting the bore in the "green" size, it is evident that the gear is located from the same bore for grinding the final size, and this will bring the bore concentric, provided that the heat treatment has not disturbed the relation of the pitch circumference to the bore, or warped the gear out of round. When the heat treating is properly done the percentage of gears so distorted is very small.

The grinding fixture shown is made from a standard magnetic chuck. A hole was bored through the center and a brass bushing (3) pressed in. Inside this is pressed a hardened steel bushing which is ground dead true after the chuck is in place on the machine spindle. The brass bushing obstructs the magnetic lines. The steel bushing forms the bearing for the locating gauge composed of the shank (2) and the plate (1).

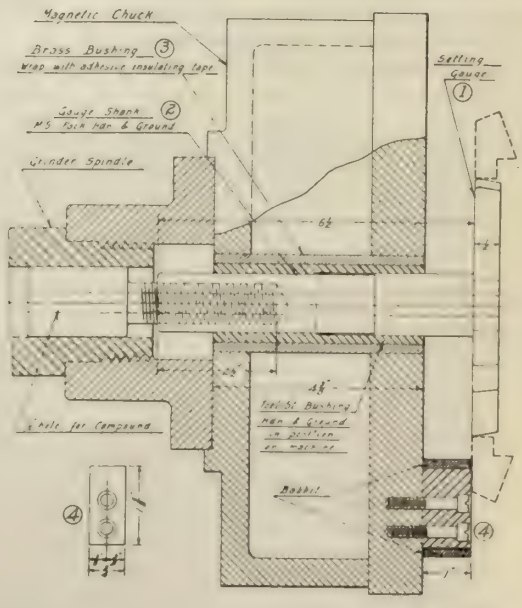
On the face of the chuck are fastened 18 steel blocks, which are really extensions of the small magnets embedded in the face of the chuck. These blocks hold the gear one inch out from the face of the chuck, allowing grinding wheel clearance after the gauge plate has been pulled back against the face of the chuck, by the draw bar operating through the spindle of the machine. These blocks are pack hardened machinery steel and the faces in contact with the chuck magnets have the "case" ground off to expose the soft core directly to the magnetic lines. A ring of babbitt is poured around the blocks, covering all but the working faces, to prevent the accumulation of chips. The face is ground off smooth and flush. The gauge plate (1) is ground cone-shaped and has three locating spots on which the gear is centered. The switch is then thrown in and the gauge plate pulled back to the face of the chuck, leaving the gear ready for grinding. This outfit is very fast, the operation being measured in seconds. The fixture is adaptable to different sizes of gears by simply changing the gauge plate (1) to the size of the piece to be ground.

## FORCING HOME A PISTON HEAD

A nut that came off inside the cylinder brought us the job of making a new rod and piston. We made a splendid fit of these but we had no good way of getting the head clear up to the shoulder on the rod. There was no press within fifty miles and we knew that we would injure something if we used the 24-lb. sledge as a "persuader."

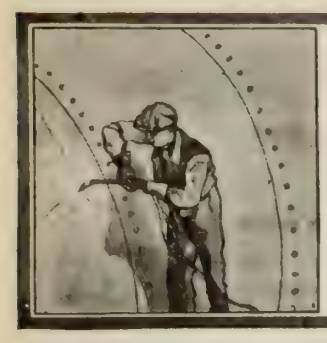
Finally we jarred the head on. It was already within an inch of the shoulder and we turned the assembly, head in the air, resting the cross head end of the rod on a piece of 3" x 12" maple plank. A length of rope to the roof truss prevented it from toppling and acted as a safety. A foot of 4" pipe secured to the plank guided the lower end. Then four good men lifted the job about 6" at a time and let it drop, soon getting the desired position with this 200-lb. head.

## CLEANING BURRS FROM THREADS



We had a screw used in our manufacturing that was milled flat across the end after it came from the automatics. The amount removed varied from 1/16 to 1/8, which was necessary to bring the starting of the thread in relation to other parts. After milling, the burr had to be entirely removed from the last thread to facilitate assembling. This was a slow, laborious job as accomplished with a file. The thread was a special 29 degree type.

The head of the department hit upon a scheme for removing these burrs that is worthy of wider use. We had sectional wire brushes, eight inches in diameter, that were used to clean up discolored drawn brass and steel parts and were discarded when worn within half an inch of the flanges which retained the bristles. A section of such a worn brush lying around served as the germ of the idea that proved so successful. One of these mounted on an emery stand became instantly a flexible, revolving file. With the screws resting in a V rest just at one side of the brush, they were revolved by hand against the wire brush and every particle of burr cleaned from the thread in an instant. The little burr thrown up, or left, on the end of the screw was unimportant. Ninety-five per cent. of the former time was saved and a better grade of work performed.



The city of Hamilton is being urged by the local Hydro department to build a city hall annex at an estimated cost of $225,000.

# *Grinding Automobile Drive Gears*

Sketch shows the arrangement of a magnetic chuck for the grinding of automobile drive gears. The chuck is bored to receive the brass bush (3) which is covered with insulating tape to break the magnetic lines. The steel bushing is pressed in and afterwards ground in position to a push fit for the gauge shank (2), on the front of which is secured the gauge plate (1). This plate has three locating spots to set the gear concentric. Eighteen small hardened blocks (4) are fastened to the chuck face. These blocks are completely enclosed in babbitt to eliminate the possibility of adhesion of chips. The gauge shank is threaded to the draw rod so that the gauge plate (1) can be drawn back after the gear has been placed in position and the switch thrown in. This device provides both accurate and rapid setting of the work. Gauge plates of different sizes may be made if desired.

# WELDING AND CUTTING

# Welding Irregular Shaped Fresh Water Tanks

## Range and Application of Electric Arc Welding Constantly Growing Wider—Repairing Air Compressor Cylinder by Studding Process—Welding Small Vertical Engine Frame

By R. E. SMYTHIES*

THIS article deals with autogenous welding by the electric arc process as distinct from electric butt and spot welding. In passing, it may be mentioned that butt welding is an unfortunate expression, by which we mean that it is misleading and ambiguous. It is used promiscuously to designate the joining of two pieces of bar stock by the resistance-welding process, and the joining of the butting edges of two steel plates, for instance, by the electric arc process. It is a pity that we ever got away from the technically correct term resistance-welding to the popular but confusing application of the term butt welding to the resistance process.

Arc welding may be described as a welding process which is in many ways similar to the oxy-acetylene process in both range and method of application, the welding heat being produced by the flame of the electric arc instead of by the combustion of gases in a specially designed torch. The temperature of the electric arc is higher than that of the gas flame, being over 6,000 degrees F., and the heat is more concentrated.

The question is often asked, "Which is the better process?" It is impossible to return a direct answer to this question. At the present stage of development it is only safe to say that some jobs can be done better by the one process and some by the other, while some can be done just as well by either. Also, each process can be used for certain applications which it is not practicable to carry out with the other.

In my opinion it is safe to say that any job that can be done by either process can be done at a much lower cost by the electric arc, especially where current is as cheap as it is in Canada. The first cost of a good direct current welder complete with equipment necessary for all ordinary jobs of welding, will be from $1,200 up, which is much higher than the cost of a gas welding outfit. The cost for current to run a 150 ampere welder, however, would be about $10 per month in most parts of Canada, and this is the only expense apart from rent and other purely overhead expenses which are common to both systems.

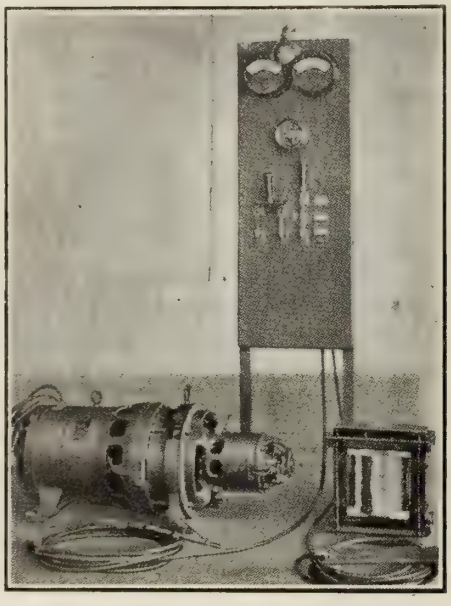

FIG. 1—LINCOLN ARC WELDER USED WHEN THE SHOP SUPPLY IS ALTERNATING CURRENT.

There is no constant handling of gas cylinders in and out, no risk of explosion and practically none of fire. With a well-designed direct current welder there is no risk of shock, on account of the very low voltage of the welding circuit, which is usually 20-30 volts. The electric welder shown in Fig. 1 is designed for use where the power supply is alternating current. It consists of a compact, three-bearing motor-generator-set, with switchboard, stabilizer and other accessories. The motor is suitable for operation on the supply current available, and the welding current is furnished by the specially designed D.C. generator which is of the variable voltage type with separate, direct coupled exciter.

A knowledge of electricity is not necessary to the making of a good electric welder, though it is necessary to a complete grasp of the design and workings

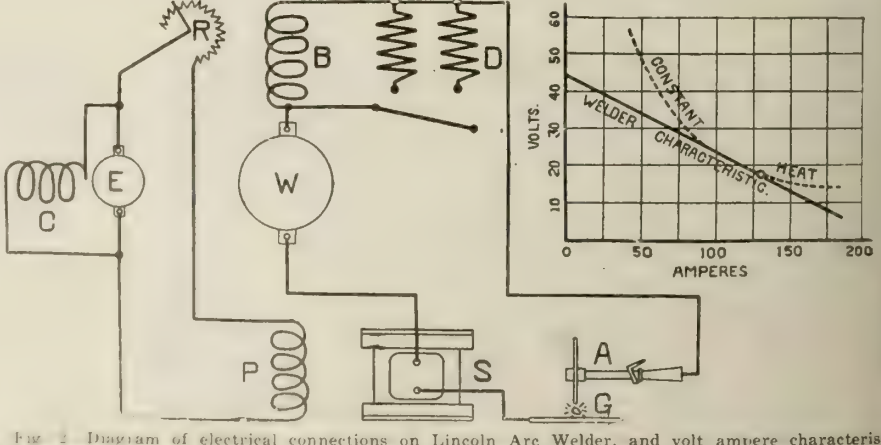

Fig. 2—Diagram of electrical connections on Lincoln Arc Welder, and volt ampere characteristic. "A" represents electrode holder; "B" series field (differential connection); "C" exciter shunt field; "D" diverter resistance; "E" exciter; "G" ground plate; "P" separately excited field; "R" rheostat; "S" stabilizer; "W" welding generator.

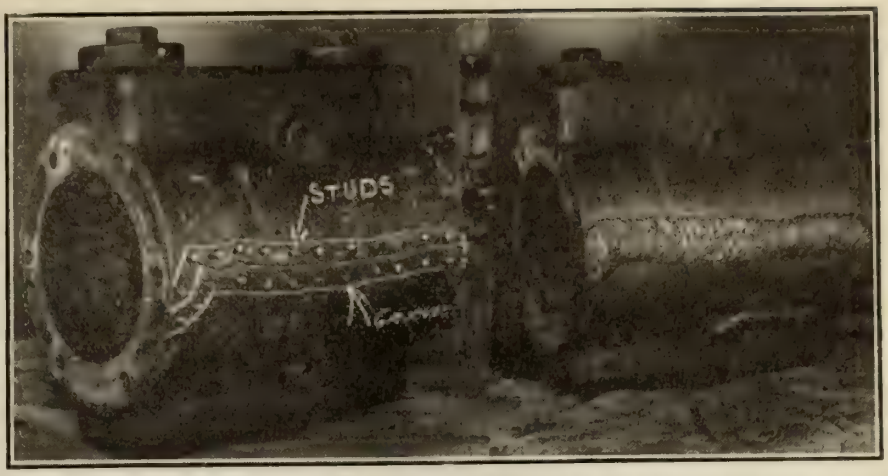
*The author is chief engineer for the Lincoln Electric Co., Toronto, Canada, and is an authority on the electric arc process. His chief object in preparing this material is to bring before Canadian manufacturers the possibilities of this process of welding.

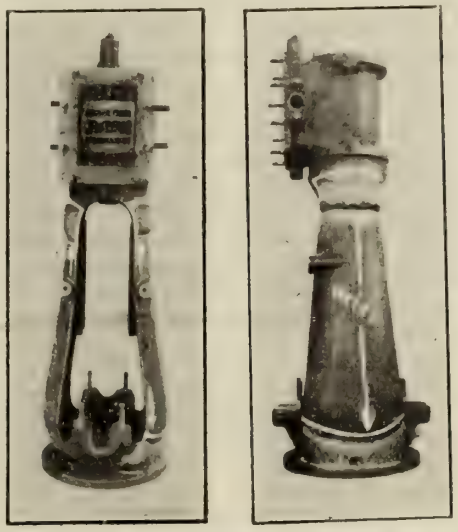


of the machine. For the benefit of the man who has had electrical experience, it is sufficient to state that the welding generator is a specially designed, separately excited generator with a differential compound winding, and that an inductive ballast is used in the arc circuit.

The diagram shown at Fig. 2 depicts the volt-ampere characteristic and wiring diagram of the welding generator.

The secret of the successful application of arc welding to every-day commercial uses lies in the design of the generator. There have been many attempts to use ordinary D. C. generators for welding purposes, with but indifferent success so far as our experience goes. It is extravagant at the best, owing to the fact that more current is wasted than used, and a much higher degree of skill in the operator is necessary, as the arc is harder to hold. With a specially designed generator the arc is steady and easy to hold, commutation troubles are unknown, and the overall efficiency of the machine is very high.

The range of application of electric arc welding is very wide and constantly growing wider. In this connection it may be said that Canada is behind other countries in the use and application of the process. She is considerably behind the United States, and Great Britain is ahead of both. In England, steel structures are actually being erected in which electric welding takes the place of riveting, and, further than this, a high pressure marine boiler has been built without a rivet in it, and has now been in use for some time.



Unquestionably Canadians should wake up to the possibilities of the process. With our cheap and plentiful electric power it should have a most important bearing on the immediate future development of many branches of the engineering industries. It might even go a long way towards putting shipbuilding on a practical commercial basis in Canada. Experimental sea-going vessels have been built entirely by electric welding, at a great reduction in cost over

FIGS. 4 AND 5—AIR COMPRESSOR CYLINDER THAT WAS REPAIRED BY THE ELECTRIC ARC PROCESS.

riveted construction, even in England, where electric power is far from cheap.

The tanks shown in Fig. 3 illustrate this point. They are ship's fresh water

FIGS. 6 AND 7—SHOWING HOW VERTICAL ENGINE FRAME WAS REPAIRED.

tanks, irregular in shape, made of quarter-inch steel and tested to 20 pounds pressure when finished. On fourteen such tanks there was a total of 2,000 linear feet of welding. The work was done by one man using the metal electrode process, in nineteen days of nine hours each, which is equal to an average rate of 11.7 feet per hour. The total cost of welding was 40 per cent. of the cost of riveting the same job. In this connection it may be noted that under certain conditions very much higher welding speeds may be obtained on this class of work, using a carbon electrode.

One difficulty, against which advocates of electric welding have to labor constantly, is the popular delusion that welding of any kind is essentially a process for repairing broken or defective parts. Repair work is a minor, though useful application. The big field for future development is in the application of arc welding to manufacturing processes in all branches of the iron and steel industry. The metals that are most commonly welded by the electric arc are steel, steel castings and cast iron. Malleable castings can be welded, and it is quite practicable to join malleable iron to steel. Copper can be welded to steel, and certain applications have been made in welding brass and bronze. Mild steel is probably the easiest metal to weld and the best for a beginner to start on. Any man of average intelli-

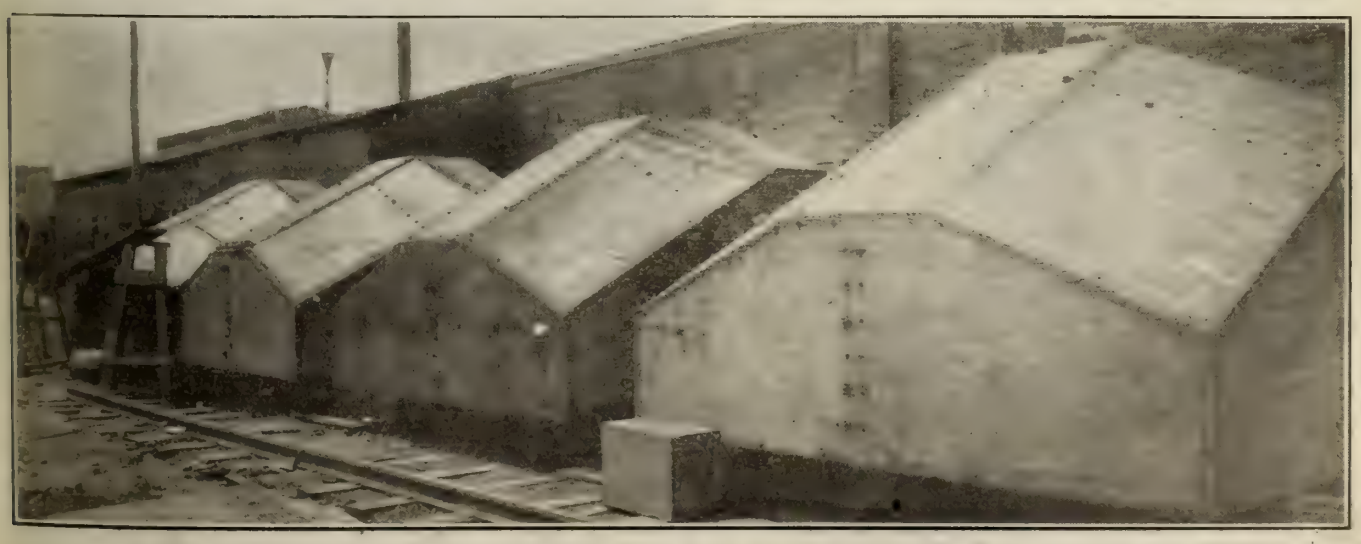


FIG. 3 THIS SHOWS SOME OF THE TANKS THAT WERE WELDED BY THE ELECTRIC ARC PROCESS.

gence can be taught to do straightforward welding such as the construction of steel storage or low-pressure tanks, in two or three weeks. High welding speed and the ability to turn out a good smooth job come with practice. Cast steel is also easy to work. It can be welded electrically without pre-heating and with the certainty of getting a good strong weld capable of standing high pressure and tremendous bending, twisting and tensile stresses.

With regard to cast iron, it is better not to make sweeping statements. Every cast iron job is a problem by itself and must be approached as such, and with due respect for the text-books which declare that cast iron cannot be welded. Recent developments have tended to furnish grounds for some revision of the text-books in this respect.

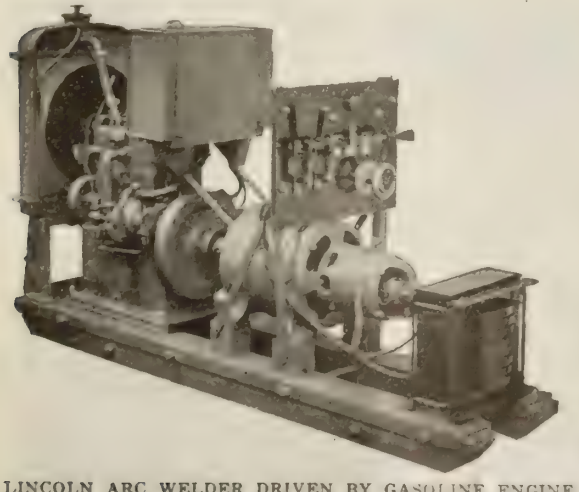
It has been found that by using certain special electrodes, what appears to be practically perfect fusion can be obtained in a cast iron weld. It is possible to fill up a hole in an iron casting and then drill a hole, half in the original casting and half in the added metal, the line of fusion not being discernible. Such welds will also have considerable tensile strength.

When speaking of welding cast iron, we mean welding without pre-heating the castings. It is considered that experimental and research work should be conducted along these lines, because, broadly speaking, pre-heating presents so many difficulties and drawbacks that any welding process which depends on it for a reasonable measure of success is necessarily subject to serious limitations on that score. The cost of pre-heating small castings is often more than they are worth, while apparatus for heating large castings is costly and bulky. Castings of complicated pattern and thin section such as automobile cylinder blocks are frequently warped or cracked in the pre-heating or subsequent cooling process.

Small castings such as handles, levers, etc., can be electrically welded very quickly and successfully by what is known as the carbon arc process. This consists of using a carbon pencil with which to strike the arc and holding a cast iron filler rod in the flame to melt and form the added metal. This method makes a very strong, smooth-looking weld and is strongly advocated for all such jobs.

The carbon electrode process is not suitable where consideration has to be given to expansion and contraction strains due to local heating and cooling of certain parts of a complicated casting such as a cylinder, press frame or any box section casting. These must be done by one or other of the various suitable metal electrodes or by what is known as the studding process.

The accompanying views at Fig. 4 and 5 depict an air compressor cylinder which was repaired by the studding process, and these illustrate the method more clearly than any number of descriptive paragraphs could ever do. Holes are drilled and tapped on each side of the crack, studs screwed in tight and left protruding about one-half inch from the cast iron. A metal electrode is then used to lace the studs together, the finished weld having the appearance of a rough steel plaster over the crack. As the weld cools there is usually just enough contraction to draw the crack tight. A weld made by this process is surprisingly strong. A great number have been made to the writer's knowledge on punch press frames and similar castings, subject to heavy working stresses, without a single known case of failure.



Figs. 6 and 7 show a small vertical steam engine that, to my mind, is one of the most remarkable pieces of "surgery" ever carried out by a job-welding shop. The frame of this engine was completely broken in three pieces, not merely cracked. When welded by dint of much patience and the studding process, it was perfectly true and as strong as ever!

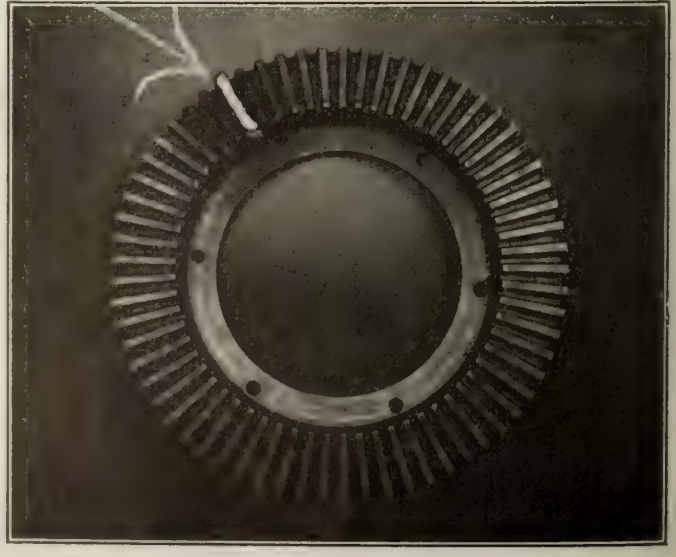
Last August the same process was used in what was probably one of the most important marine repair jobs ever carried out on the Great Lakes. The steamer Chippewa suddenly developed a 40-inch crack in her main engine cylinder, which is 5 feet 6 inches in diameter by 11-ft. stroke. It took only twenty-six hours straight work to weld that crack up, so the well-known Niagara boat was not out of commission very long. So far as we know, the only alternative was to lay her up for the rest of the season.

Fig. 8 illustrates a piece of salvage which was well worth while. A broken tooth in this steel gear out of an English made automobile was built up by the electric arc. A special steel electrode was used to produce a hardened surface. This work can be done without softening the adjacent teeth. The replacement cost in this case would have been thirty times the actual charge made for welding.

A few weeks ago a remarkable repair job was carried out on a 1,000 k. w. motor generator set in a station of the Toronto and Niagara power company. A revolving cast steel spider about eight feet in diameter, having field coils on the periphery was found to have three adjacent spokes cracked clean through. Replacement would have cost many hundreds, possibly two or three thousand dollars, as well as tying a badly needed machine up for many weeks. The electric welder repaired the damage in two days, without removing or disturbing any part of the machine.

In an article of this nature it is, of course, only possible to give the barest outline of arc welding, its present applications and future possibilities. To the engineer who has looked into the matter to any extent, the possibilities seem unlimited. It is to be hoped sincerely that Canadian engineers and manufacturers will wake up shortly to some more of these possibilities. At present their English and American confreres and competitors are ahead of them, on arc welding at any rate!

LINCOLN ARC WELDER DRIVEN BY GASOLINE ENGINE. THIS TYPE OF WELDER CAN BE MOUNTED IN ANY STYLE DESIRED, AND CAN BE TAKEN TO WHATEVER PLACE THE WORK IS BEING DONE.



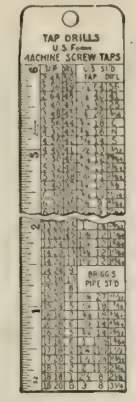


FIG. 8—THE TOOTH ON THIS GEAR WAS BUILT UP BY THE ARC WELDER USING A STEEL ELECTRODE TO PRODUCE A HARDENED SURFACE.

# Improve Your Powers of Perception—Try This Contest

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

B. Back, Hamilton, Ont., is the prize winner for April 14th contest. Chas. E. Mars, Brantford and J. A. Scarsbrook, Winnipeg, had correct lists, but lost out in the regular elimination test. One of the contestants asks this question: "Can the same advertisement be allotted to two different questions." Our answer to this is "No." We always use one question to one advertisement.

**CONTEST FOR MAY 5TH ISSUE**

**Contestants are required to write us, stating to which advertisements we refer in this number.**

1—Something that is elusive

2—How to save fuel, increase production, and lower maintenance costs.

3—How to save a good deal of time and expense.

4—Something that arrives at the tool under 80 lbs. pressure.

5—A chance to do a great favor.

6—Something that is made at customers' specifications.

7—A machine that has been in operation for three years.

8—Something that is said to encircle the globe.

9—How to get your work out ahead of schedule.

10—Something that deserves consideration.

11—A certain line that differs.

12—A product that takes heat away from the tool.

**These are Correct Answers for List from April 14th Issue:**

1—Fairbanks-Morse Co.

2—John Bertram & Sons Co., Ltd.

3—Hendey Machine Co.

4—Butterfield & Co.

5—Crane Ltd.

6—John T. Hepburn, Ltd.

7—W. S. Rockwell Co.

8—Bristol Co.

9—Geometric Tool Co.

10—Nicholson File Co.

11—Pratt & Whitney Co.

12—Brown & Sharpe Co.

## Closing Date for This Contest is May 26th

# A Heavy Duty Railroad Shaper of New Desig

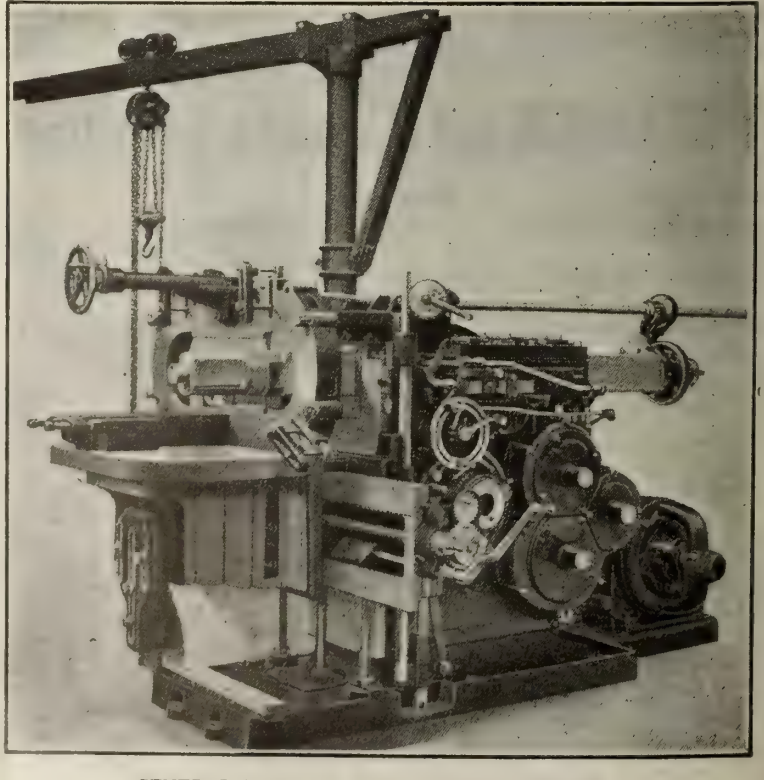
## This Machine Uses the Draw Cut—Claims Are Made for This Principle — Details of Construction — Examples of Work Produced, and Other Features, Dealing With Points in Design

A SPECIAL heavy-duty railroad shaper has been placed on the market by the Morton Manufacturing Co., Muskegon Heights, Mich. This company has concentrated its efforts in developing the application of the "draw-cut" principle to shapers, vertical and horizontal travelling head planers and keyway cutting machines. They have made a study of the methods of production in railroad shops, and the shaper described has been developed to fill the demand for increased production of driving boxes, crown brasses, shoes and wedges, and connecting rod brasses. While we shall describe the standard style, it is to be understood that these machines can be adapted to any special requirements.

Speaking on the draw cut principle this concern make the following claims: Owing to the ram being in tension, rather than compression, the tool adjusts itself to inequalities in the surface of work as it is being drawn through, thus allowing deeper and heavier cuts to be taken. Vibration is practically eliminated, smoother work is obtainable, and special forming tools can be used to advantage. Cutting strains to the various bearings are eliminated, and tools can be used with greater clearance angles, this reducing the cutting friction, at the same time increasing the life of the tool. Shaping to lines can be easily and accurately accomplished, as the lines are always in full view and are not broken until the tool cuts them out. It is also claimed that this style shaper is a multi-duty machine, as well as a specialized railroad tool, and that the changing of machine from one class of work to another is rapidly accomplished.

### Details of Construction

The column is a heavy box section casting provided with square rail bearings. All running bearings are fitted into accurately bored holes and held in position by bolts. This makes the use of dowel pins unnecessary, and maintains the alignment and rigidity of the journals. The cross-rail moves on square bearings at the front of the column. It is raised and lowered by nuts and screws and can be clamped quickly in any position. It is provided with gibs adjustable for wear. A counterbalance for the cross-rail is furnished on account of the weight of the special attachments. The saddle is fitted to square rail bearings on the cross-rail. Angular gibs provide the adjustment for wear.



The table is a rigid box section casting. Two sides are "T" slotted. The upper one forms the bolting surface for the vise, top table and attachments. An angular extension bolts to the other "T" slotted surface to facilitate the rapid and positive binding of driving boxes when machining the shoe and wedge fit. The "T" slotted top table provides a large bolting surface for work.

The vise is so constructed that the tendency of the work to raise or buckle when placed on parallels is largely overcome. Ordinarily the entire cutting strain is taken by the vise jaws, and excessive clamping is necessary to secure the work. The results are spring and distortion. The cutting strains in this particular machine are said to be transferred through the solid vise jaw to the back-bearing and column. Only comparatively light clamping is necessary. When planing parallel to the jaws, the adjustable backbearing forms a stop for the work. The body of the vise is of steel. The sliding jaw is of special metal with a steel facing. Two screws control its motion. The stationary jaw has parallel planed ends which can be set snugly against the adjustable backbearing, with a consequent reduction in the strains to which the vise is subjected when a cut is taken. Its base is graduated through 180 degrees.

The adjustable backbearing is mounted on a post bolted to the cross-rail. It can be moved vertically to the desired position or swung to one side out of t way when using special attachments. transfers the thrust of the cut direct to the column of the machine. This r lieves the strains on work holding fi tures and the table bolts, lessening t danger of deforming the work by bi ing it too tightly. An auxiliary bac bearing is bolted to the top of the m chine for transferring the thrust of t cut to the column when using the dr ing box attachment. It swings out the way when not in use. The ram steel and is cast hollow. The scale the inner walls adds greatly to strength and stiffness. The ram has bearing surface on all four si throughout the length of the column, cept for a small oil space in the cent where the rack is lubricated. The ra teeth are machine cut. A bronze str inserted centrally in the rack, suppl a continuous bearing surface for the b tom side of ram. Wear can be taken at the sides by adjusting taper gi and at the top by lowering the ram c which is adjustable by means of t screws. The ram is bored at each e to receive an arbor.

### Other Features

The rotating arbor is a hollow st forging. It has close fitting journals each end and revolves in the ram, giv

GENERAL VIEW OF THE RAILROAD SHAPER.

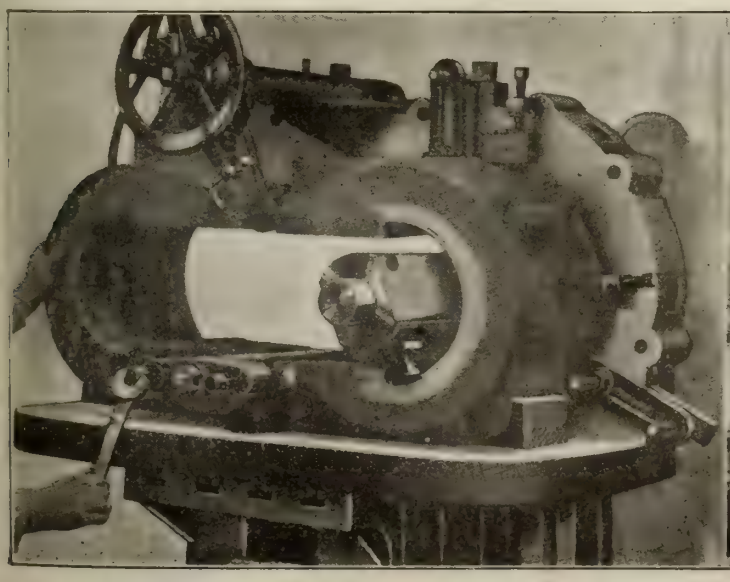
the circular feed to the rotating head for cutting the crown fit in driving boxes. The front end is bored tapering to receive the rotary head. The shaper head is of steel, carefully fitted to the threaded end of the ram. It is graduated and can be held at any angle by a suitable clamping device. The sliding part of the head is made with the usual "V" joint, but has also adjustable side clamps with square rail bearings, which insures rigidity of the head. The swivel or tool block is threaded and fitted into the slide. It is held in position by a clamping device. The tool can be set at any desired angle. The reciprocating motion of the ram is obtained by the use of compound disc friction clutches, running inside the column in a bath of oil. Sliding collars and forged compression levers, adjustable for wear, give the necessary pressure. This design eliminates close fitting periphery surfaces which lose their size, causing trouble and necessitating new parts. The flat discs can be refilled at small expense. The material used will not injure the metallic surfaces of the clutches. A simple shifting bar and revolving cam reverse the clutches for the return stroke of the ram. The machine can be started and stopped by a clutch, independent of the driving motor. The ram may be moved as little as 1-16 inch at a time if desired.

The main driving pinion is a steel forging with teeth cut from the solid. All gearing is liberally proportioned, and the shafts are ground cylindrically true and straight. The stroke is adjusted by tappets on a circular disc, and can be changed while the machine is in operation. The adjustments are said to be so fine that the machine will take a cut and reverse close to a line. The reverse may be controlled by a lever at the will of the operator, for short stroking. A rapid power traverse for raising and lowering the cross rail and moving the saddle sideways in either direction is provided. The feed is relieved automatically. Any horizontal or vertical feed within a wide range is obtained quickly by moving tappets on a disc. The feed screws have a coarse pitch acme thread.

Rotary feed for the arbor is obtained from the regular automatic feed by means of a gear and ratchet working in connection with a vertical rack. The rotary motion is transmitted through a spline shaft and gears to the arbor which may be fed automatically in either direction.

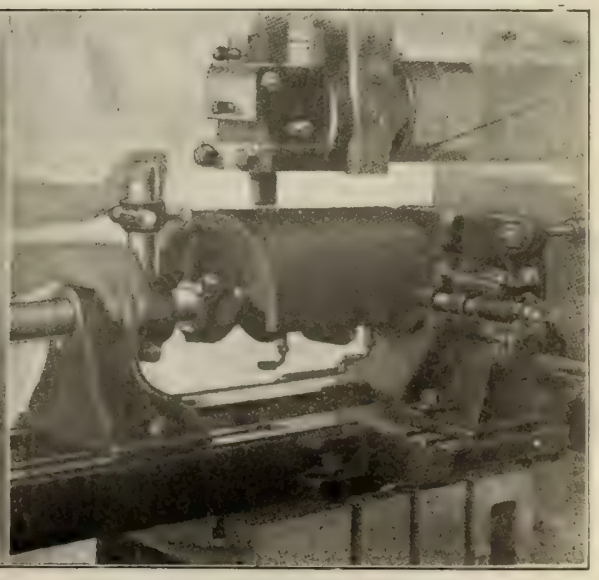
A splash system of oiling is used for the clutches and all shaft bearings which are subjected to heavy strains. When the machine is running, oil is pumped from a tank in the column to the ram. The belt driven machine is furnished with a two speed countershaft. Two cutting speeds are obtained by the use of an additional pulley. The countershaft furnished hangs from the ceiling. A single belt transmits the power to the machine. Motor drive for either d.c. or a.c. can be installed, but a d.c. variable speed motor with automatic push button control is recommended. A controller guard is supplied with motor driven machines. The crane and hoist are used for handling the vise, attachments, and work too heavy to be moved by hand. A two-speed chain hoist is used. The control of this machine is entirely from the right-hand side, and all levers are said to be within easy reach of the operator.

The double chuck for driving boxes, as illustrated, forms a portion of the regular equipment. It is made in the form of an angle plate, which bolts securely to the knee of the machine, and is lined at right angles to the ram. It is provided with a suitable opening for the ram and special rotating head to pass through. Adjustable stops and binders secure the various sized driving boxes to the chuck. A special rotating head for crowning driving boxes forms another part of the equipment.



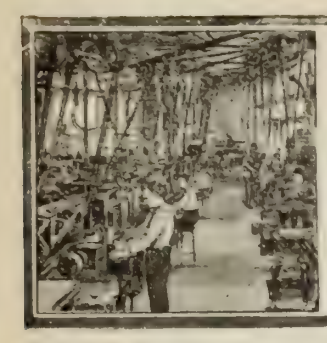
Special attachments, such as driving box shell planing attachment, shoe and wedge fixture, rod brass attachment, etc., etc., are available if required.

## AN AMBULANCE AEROPLANE



The latest innovation in air craft is the "ambulance aeroplane." A British firm has completed the first machine of this type. It is an adaptation of the firm's regular commercial model for passenger service. The forward part of the fuselage is arranged to accommodate four stretcher cases as well as a doctor, nurse, pilot and mechanic. If the patients are able to sit up, eight of them can be carried. The cabin to which the stretcher cases are admitted is provided with lavatory accommodation and with special cooling arrangements for use in tropical climates. The machine can climb to 6,500 feet in ten minutes and at that height it can be driven at a speed of over 100 miles an hour. Enough oil and petrol are carried for a five hours' journey at full speed. The machine, which is fitted with wireless telegraph apparatus, will be used in operations remote from a hospital base.

## AN ADAPTABLE WRENCH



The Universal Wrench Co., Detroit, Mich., have opened a factory and office in Windsor, where they will manufacture their universal adjustable wrench. This wrench differs from the usual type of adjustable wrench by the addition of a lever mechanism which permits of pressure being applied to the jaws. A heavy duty spring opens the jaws to the determined position, when the lever is released. Among other advantages claimed is the non-slip feature—as it is said that the wrench cannot slip off the nut. It is also adaptable to smaller space as the handle need not be swung from flat to flat, but only far enough to permit the grooved jaw to grip on the nut angle. These wrenches are made of special material and are turned out in sizes from 4 to 18 inches.

# DEVELOPMENTS IN SHOP EQUIPMENT

## INDEX CENTRES

Miller and Crowningshield, Greenfield, Mass., have placed on the market a multiple-spindle index centre as shown in the illustration. These centres are designed to permit the rapid fluting and squaring of taps, reamers, etc. The device is made with one, three, four, five, six or eight spindles, all of which rotate in the same direction. The spindles are spaced closely, so that the several pieces of work will be held in as small a space as possible, and they are connected by equalizing levers that allow a variation of about 3/16 inch in the length of the work being milled. The spindles have tapered holes, and a drift is furnished to interchange centres. All spindles are tightened simultaneously by operating a single handle.

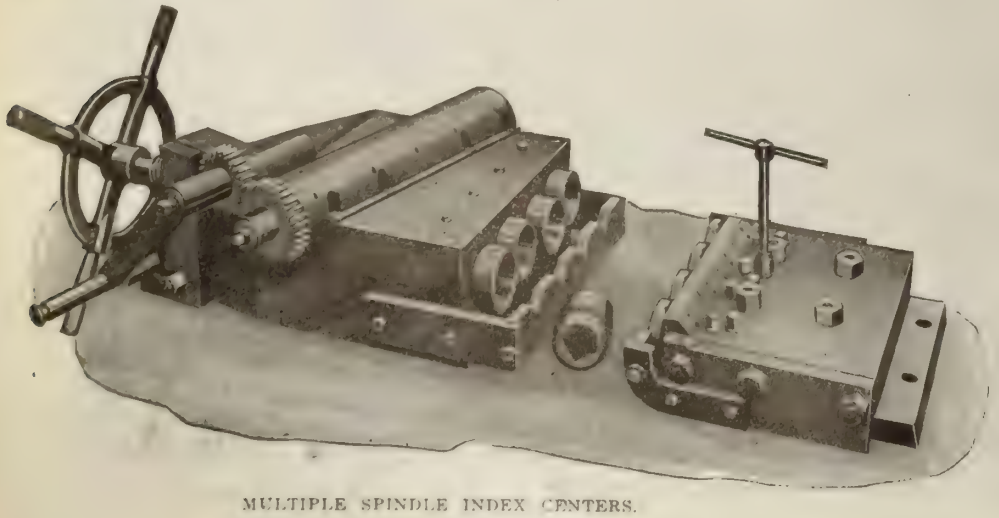
Any number of flutes from one to twenty can be machined on work mounted on these centres, the proper indexing being obtainable by changing a spur gear. The indexing of all the different spindles is accomplished by turning a handle. In squaring and fluting work with only four flutes, no gearing is required, as one revolution of the index handle turns the spindles a quarter of a revolution. The tail block is separate from the head block and it is made in two styles, one solid, and the other having a separate vertical adjustment for each centre. Both types have the same interchangeable tail-centres, which can be readily replaced if they become broken or worn out.

## KEYWAY SET

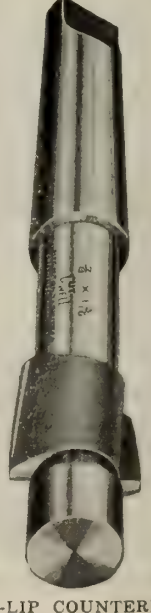
The Velco Mfg. Co., Inc., Greenfield, Mass., have placed on the market a broach keyway set as shown. These broaches are equipped with patented staggered tooth cutter bars, and are said to cut smooth finished keyways with the use of the ordinary arbor press. The idea is this:

The work is slipped on to an accurately sized bushing, the tool steel cutter is inserted, the work is placed under an arbor press, and the tool is pressed through similar to any ordinary arbor. Should more than one keyway be desired in the same piece, the work is turned around to the required angle and the operation repeated.

The set is said to be particularly useful when cutting keyways in pulley hubs, couplings, milling cutters, etc., and where necessary half-round special broaches can be made. The complete set weighs only seven pounds and will cut ¼-inch keyways in work up to 1⅝ inches long, 3-16-inch keyways up to 1½ inches long and ⅛-inch keyways up to 1¼ inches long. Bushings from ½ inch to 1½ inches are included.



VIEW SHOWING THE KEYWAY SET.



## TWO LIP COUNTERBORE

The Bickford-Switzer Co., Greenfield Mass., have placed on the market a counterbore of new design. This is shown in the illustration. This tool has been designed for counterboring on a production basis, and has two lips. It is said to have ample clearance, and with the spiral flutes will cut faster and even longer than the regular style counterbore.

Chattering is said to be eliminated and special provision has been made for sharpening. The body is circular between the cutters, in this way maintaining a pilot until the tool is worn out.

MULTIPLE SPINDLE INDEX CENTERS.

TWO-LIP COUNTERBORE.

### SELF-LOADING WAREHOUSE TRUCK

The Lewis-Shapard Co., of Boston, ass., are now making a self-loading rehouse truck, built in two sizes, one ving a capacity of 800 pounds, and the er capable of handling a load of 1,200 unds. The truck is of all metal con-uction and fitted with Hyatt roller arings. The grab hook may be placed 38 different positions, 10 vertically d 28 horizontally. The respective eights are 72 and 76 pounds.

### MOTOR DRIVE FOR MILLING MACHINES

The Clark-Mesker Co., of Cleveland, hio, is now making a special bracket r attachment to the Cleveland milling achines for direct motor drive. Pro-sion is made for a friction clutch be-ween the lower sprocket and the main ive shaft. This drive may be fitted to xisting belt driven machines by simply olting the bracket to the column in lace of the single-pulley belt-drive hous-ig. The motor speed is approximately 200 r.p.m. and drive from the motor to ie machine shaft is by means of a lorse chain.

### NEW SCOOP CAR TRAILER

A new scoop car trailer which is quipped with flat tread, instead of nar-ow gage track wheels, and which it is aid can be pulled around anywhere and easily handled by one man, is being ffered to the trade by the Easton Car Construction Co., 50 Church Street, ew York. It is designed for a variety f work ranging from the handling of teel chips, small forgings and castings, nd other material in machine shops, to he handling of coal, coke and cinders in nd around boiler houses and foundries. ts capacity is 27 cubic feet and it is uilt low to facilitate hand loading. The ody is mounted on a structural turn-able and can be turned around in any irection and dumped from any one of he four sides. The front axle is of the wivel type, equipped with a machined ast-iron ball-bearing turntable, permit-ing the car to be turned in practically s own length. The wheels are of the ide-in-the-hub type. A study of the illustration herewith will allow readers to form a general mind picture of this trailer.

### ROTARY-TABLE FOR MILLING MACHINES

The Cleveland milling machines can now be fitted with rotary tables made by the Clark-Mesker Co., of Cleveland. A table is made for each size of milling machine. When power feed is used, six-teen changes are possible, and these are controlled by the same lever that oper-ated the feeds for the sliding table. Telescopic sleeves connect the worm shaft, the worm running in oil. The worm wheel below the table is of large diameter. The table rests in taper bear-ings and an automatic trip is provided for release at any desired point. By us-ing a crank and index plate the attach-ment can be adapted to the cutting of large gears.

### PATTERN MILLING MACHINE

The Oliver Machinery Co., Grand Rapids, Mich., have placed on the mar-ket a pattern milling machine known as the Oliver No. 75. This machine has been used for some time with success in milling wood patterns, but the illus-tration shown is that of milling an aluminum pattern. Soft metal patterns of any description can be milled, and we have information to the effect that a very high percentage of saving was ob-tained in one pattern works alone through the use of this machine.

## Business Papers at Washington

SECRETARY of Commerce Hon. Herbert Hoover has arranged to meet with business paper editors at Washington at regular intervals for the purpose of discussing in what way these papers can best serve the interests of the nation.

Mr. Hoover recognizes that these papers have a real field and that they are performing a real service. It is the part of good politics for him to take advantage of their columns.

The plan of meeting with these editors gives the latter a new and vital interest in affairs at Washington and they are far more likely to give intelligent assistance to a government department that is ready to meet with them and give them the facts than with one that leaves them to dig for what they can find.

The fact that Hon. Herbert Hoover considers it worth while to confer with business paper editors shows the standing the business press has attained in United states.

When the Secretary of Commerce at Washington links up with the 500 business papers of the States and through them gets to the millions of people that these papers reach in the business world, he has placed his department in line with a force that is going to be of real assistance to him.

## There's a Real Point Here

MANUFACTURERS in general are faced with the problem of keeping their establishments going and making the best showing possible in a period such as we are going through. There are plenty to give advice, but much of it is not practicable because it comes from men who have no intimate, every-day connection with the machine shop, the foundry or the office.

A Toronto manufacturer made a worth while point in discussing this matter with Canadian Machinery a few days ago.

"There are many things people can do in going through a period such as we have been in for the past six months, but the trouble is that the plan I may try at my shop may not be much use any place else.

"But remember this, there are certain foundations that one can never allow to be broken down. These must be kept up if you are going to stay in business at all. There is the danger of cutting your business movement too fine. There is the danger of cutting the wages of your men, particularly your foremen and superintendents to the point where it takes the conceit and the pride out of them. When this is reached it is better to turn the key in the door and quit until things turn for the better.

"It is possible to run your business like a man trying to save fuel in his boiler. He starts to bank the fires and he starts to use clinkers instead of good coal. After a time he finds there is a call for steam some day and he is not able to produce it because his fire has gone too low. That may be a homely way of stating the case, but it has the real point, viz., that there are well-defined limits in the way of curtailment and it is not safe to go beyond them."

This same warning is capable of very general application. Some firms find it necessary to curtail their publicity. Quite right. Others cut it to the point where they are banking the fires where they are depending on the clinkers of past services and connections to keep up the fires of business accounts.

Some day there is going to be a call for real, live steam—for action, and the firm that is ready is going to move out in advance, while others are shovelling out ashes and clinkers and tearing down the banking they have put on their fires.

## None Working — No Strike

ONE of the most remarkable statements made in connection with the May Day strikes, or rather the lack of them, was by one union official who stated that owing to the large number of their men who were out of work there would be no strike.

In other words, had things been going on as usual and had their members been making a decent living, instead of nothing at all, they would have staged a strike.

But now that they had very few members at work, the strike had been passed up for this year.

It would seem, then, that the proper way to avoid strikes is to have plenty of unemployment.

## Canadian Trade Worth While

The New York Herald says editorially: "Deflation and its consequent check on international commerce have placed in bold relief no more satisfying development than the consistent growth and stability of the Dominion of Canada's foreign trade. Especially gratifying has been the steady enlargement, through prosperity and adversity, of the commercial and also the purely financial relations between the Dominion and the United States. Not only does this country occupy first place in Canadian trade, but our money investments in Canada far exceed what might have been anticipated only a short while ago.

"Here is consistency in trade which it would be hard to surpass. Canada's trade strategy has been that of her tutor, England. With three-fourths of her territory still to be developed, her commercial wisdom already has built for her an enviable place in the commerce of the world.

"Ill-conceived restrictions may deflect the currents and benefits of her commerce, but she has hit her stride in the path of progress and there will be no stopping her. Canadian trade with the United States is of the kind that will repay the most sympathetic and intensive cultivation."

## WE ARE NOT TURNING OUT APPRENTICES NOW

**F. W. Bawden Believes That as a Result There Is a Better Opening Now Than Ever Before**

"I venture to say you can put on the fingers of your hand the number of apprentices to the machine shop or iron molding shops that have been finished in the past year." That is the estimate that F. M. Bawden, of the Bawden Machinery Co., Toronto, puts on the present apprenticeship system.

"I can't see any way out until we get a class of boys who will take some interest in their work. It seems to be little use trying to get manufacturers to stop stealing boys from each other. The very fact that so few boys are going all the way through these two trades, the machine shop and the iron foundry, makes it all the more desirable that there should be some to make the start, for there are good openings for the men who finish thoroughly.

"The production methods of some of the shops make it very easy for them to take a boy who has had a year or two good training and give him a figure to do production work that makes the boy dizzy. I can recall being in one of the American centres about a year or so ago, when they had such a demand for production in the automobile shops. Several boys were apprentices in a shop where they build a very fine line of machine tools. These chaps, as lathe hands, were good and their general knowledge, as far as they had gone, was excellent. They were on the way to turning out to be good foremen or superintendents. The automobile shop had men on the lookout for just such boys and they baited them with wages of $6 a day, which, of course, looked a whole lot to the boys who were then making about $7 per week. Most of those who were approached in this way fell for the big money and as mechanics they stopped right there and then. They went in as production men in the auto shop and as long as things were going well they made the better money, but they ceased to develop. The man who took those lads out of the shop where they were learning to be real machine tool builders, and perhaps later designers, did them a mighty poor turn.

"We are not turning out mechanics in Canada, neither are they coming to us from other countries," continued Mr. Bawden. "As I said before, the molding shops are not getting them, neither are the machine shops. We need boys who at sixteen are neither cigarette fiends nor running around at nights. Out of these chaps we can make mechanics. I would almost venture to say that as a result of the system, or the lack of it, in regard to apprentices, we will be paying more eighteen months from now for machinists and molders than we were during the years of the war. If there is any other way out I can't see it."

## Using the Booster Engine

DESPATCHES from Kingston, Ont., state that several locomotives being completed by the Canadian Locomotive Co. are fitted with the booster engine, the first to be used on Canadian-made engines.

The auxiliary tractor idea is not a new one, although as it stands at present it is a great improvement over the first attempts in this direction.

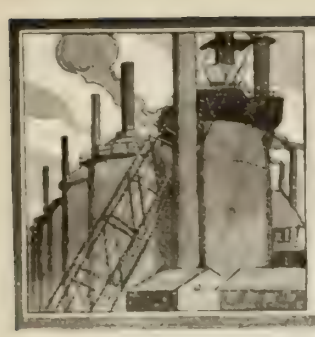
It is in reality a small engine, two-cylinder, geared to the trailer axle of the locomotive. Steam is furnished direct from the boiler. The advantage is in starting from points at rest, or in furnishing additional power on grades. When the load can be just as well handled by the locomotive, then the booster is shut off.

Tests made out of Kingston on a trial run were apparently quite satisfactory and the little auxiliary power plant responded splendidly when the call was made for more power. A number of other engines that are being built at Kingston now are having the same device attached.

When the idea was first covered by patents as far back as 1889, the idea apparently was to have these auxiliaries attached to several cars, as the wording of the patent says:

> "The equipment being such as described, it will be seen that each motor will receive live steam from the boiler independently, and will exert its power upon the particular car to which it is attached. If each motor, for example, be of six horse, a one hundred horse power boiler will supply eighteen motors and propel a train of that number of loaded cars up heavy grades with ease and speed."

It is not known if that idea was ever put into practical use. The difficulties of supplying steam to a string of cars for the purposes of driving various engines are apparent and the upkeep of these numerous small engines would be no small consideration.



A writer in a technical paper, after reviewing the uses of the various types, sums up by saying that (first), that an appliance whereby a temporary increase of the tractive power of a locomotive may be afforded will be found to be of substantial practical value; (second), that the weight and cost of construction and maintenance of such an appliance should be reduced to the minimum; and, (third), that its design should not contemplate increased power for hauling tonnage after the locomotive has got the train in motion, but should be confined to means for enabling the engine to start the maximum tonnage that it is adapted to handle, from points of rest at which the train could only be started by backing up to more favorable position for a start.

---

Some idea of the force of the explosion of a flywheel is furnished from an incident in Richmond, Kentucky. A flywheel burst at the plant of the Utilities Company. Wrecking the engine beyond hope of repair, part of the wheel ripped through the roof and buried itself in the ground half a mile away. In its flight it crashed through a house, entering by the roof, passing through and leaving by the side. As it did so it struck and instantly killed a child and injured a young woman. Investigation has given no cause or reason for the explosion.

**We can't travel with one wheel on the high road and one on the low road.**

# MARKET DEVELOPMENTS

## Prices Seem Steady at Present in all the Markets

### Effect of Pittsburgh Price Seems to Have Done Away With Much Of the Price Cutting—Passing of May Day Helps to Remove Cause of More Trouble—U. S. Export Trade Falls Off

MARKET conditions are not undergoing any marked changes, either in iron, steel or machine tools. Managers of many warehouses are kept in an anxious state of mind between reducing stocks in order to clear out high-priced material, and, on the other hand, keeping the stock sufficiently well assorted to give the service to the customers that they must give in order to hold their place in the trade.

Manufacturers in the iron and steel lines are in the same position. They must, of necessity, cut their overhead severely and at the same time keep up the nucleus of an efficient and effective organization for the time when the turn in business comes.

Most of the buyers of iron and steel seem satisfied that the present quotations on these lines are reasonable and should be the ruling figures of the market for some time to come. But that is not causing an increase of buying to any marked extent and the dealers state very frankly that they do not expect this increase until the buyers find it necessary to buy for some definite manufacturing programme.

But there are some concerns that report business as being very fair. They are securing some satisfactory orders and although the volume is not as great as a year ago by any means, they are satisfied with their progress.

Prices remain much the same in the steel trade locally and it is hardly to be expected that there will be changes for some time. There are variations in prices, but these come from dealers who still house more high-priced stock than they care to swing and they are letting certain tonnages pass out at a favorable figure to the buyer.

The scrap metal markets show no change. Dealers could probably secure contracts at to-day's figures, but they will not take them as they know it would be very difficult for them to go out and buy the material necessary to fill them at to-day's prices. Those having scrap prefer to hold it than sacrifice at the figures of this market.

## MONTREAL WAREHOUSES NAME NEW PRICES ON BAR MILL MATERIALS

Special to CANADIAN MACHINERY

MONTREAL, May 5.—May-day has come and gone and with it some of the nervousness that featured business a week or so ago seems to have disappeared, although industry is still disturbed by the rumblings of wage and working agreements. It does not seem that the metal working trades will be seriously affected in this respect, as those chiefly concerned are the building and the printing trades. It is even thought that early and satisfactory adjustments will be made in industries affected. Business activity in this district shows gradual but slight improvement, even though some reports indicate marked depression. Others reflect better business, so that on the whole there is a feeling that a slow return to normal is taking place.

### Bar Base Quotations Lower

While the steel situation here has become steadier as a result of the recent stabilization of prices in the States the market cannot be said to be one where a definite price prevails throughout all quarters of the trade. The liquidation of stocks is still going on and quotations fluctuate with the nature of the order and the needs of the customer. Orders range from tons to small parcels in pound weights of less than two figures. Despite the realization that steel prices are likely to remain quite firm for some time there has been little evidence of active buying on the part of many consumers, and the situation has changed but little from that of the past couple of months. It is thought by dealers here that no pronounced change in attitude will be shown until more settled conditions obtain in regard to railroad affairs. There has been a revision in local steel quotations, the base on bars being now $3.75 per hundred lbs. Quotations on chequered floor plates are now 6 cents per lb. Better movement for tubes and sheets is reported for last week.

### Buying Still Limited

Users of machine tools are still refraining from placing orders for equipment other than that required for immediate needs. The general situation has not improved sufficiently to warrant the expenditure necessary in acquiring machinery that would only be used in busy times, and this still seems to be an unknown quantity and one that will only be used in solving the problem of the future. The question of the present is one of keeping down the overhead, and doing with what you have got is one way out of the difficulty. This is evidently the attitude of the majority of the consumers, and the reaction on general business is that of retarding production, and consequently delaying the time when normal business will be the order of the day. It is often found that in order to make a sale the dealer or the salesman will require to meet the purchaser in the matter of price, as only in this way will the user be persuaded to buy. This condition is particularly pronounced in the acquisition of supplies, as it is these lines that the consumer must have, and yet has the choice of selecting from a great number of dealers, or calling salesmen, and in a measure, getting each seller to compete against the other for business. It is doubtless true that the prices ruling to-day are the lowest that could possibly obtain under the existing conditions of manufacture, where very

often the cost of production is on a par with the prices received for the goods.

### Scrap Still Stagnant

"There is nothing to indicate that industrial activity is on the increase, as business in general continues more or less quiet. Past experience has shown us that the forerunner of active times, invariably, is noticeable in the old material yards before any appreciable improvement is visible in other directions. This is caused by the period of preparation usually necessary in getting back to busier times, when plants and factories are laying in a stock of raw materials for manufacturing purposes. The demand for all grades of scrap is very light and prices (though firm as quotations) are subject to change with the conditions under which the sale is made." This statement by an old material dealer reflects the continued dullness prevailing in scrap circles, and the consensus of opinion seems to justify the claim that the summer will be well spent before active operations will be resumed.

## LITTLE CHANGE IN TORONTO DISTRICT

**Market Conditions Remain Much the Same—Buying Being Done in Small Quantities**

TORONTO.—Market conditions in this district remain spotty. Were a person to make one or two calls, and if these calls happened to be on the ultra-conservative class, the conclusion might easily be formed that there was no business moving at all. On the other hand by the time one has gone over a dozen or so places in the machine tool, steel and iron market, it is found that although the general business moving is small in volume there are several bright spots where firms are getting a fair amount of orders. In the latter class, when the previous months and and general conditions are considered, there is a marked tendency to state openly that business is improving, and that they have no reason to complain.

Various guesses are put out for the holding up of orders during the last couple of weeks, when it has been quite noticeable. One is that the payment of the income tax has taken up a lot of money, and has also had the effect of making people hang on tighter to what they have. Another is the amount of money that is being put into the stocking up of cellars against the last day of importation. There is no doubt considerable reason for the advancing of both reasons.

### Orders Are Not Placed

Almost any dealer can show you a fair list of prospects, and from a number of these he is quite certain that he is going to secure orders. For the present, though, the orders are not being placed, and dealers who are specializing on a few lines are having it harder than firms that are carrying a more varied line. April has not been a good month for most of the firms, although some of them could not state definitely how it compared with other months this year and last. The month in a number of cases seemed to start out very well, but before it had gone half way there was another slowing down, which tended to spoil the totals for the whole period.

### Stocks Getting Low

Evidence that the policy of getting stock down to the minimum is having its effect is found in several places. For some time some of the firms handling a large number of lines have been selling out as though they had no thought of continuing in business. Ordering has been done direct to the factories just as requirements made it necessary, and there has been a decided departure from the old idea of the well-assorted stock-rooms. There are cases coming to notice where stocks are not kept up well enough to cater to trade that comes into the market quickly and that wants immediate service. One dealer instanced this week a case where there were twenty-two of a certain article wanted, and he could supply only eight. He did not get the order for the eight because the purchaser found some other place where he could place his whole order in the one lot.

"It requires a lot of study to avoid just such a happening as that," commented the dealer. "We want to get our stock down to the bone, and yet once we get it down in that direction we run into the danger of not being able to look after our customers. Once the trade gets the idea that your stock is shot to pieces you have lost ground that is going to take hard work to regain in the future. There are two options, keeping stock up and taking your losses as goods are marked down, or getting rid of your stock and protecting yourself against a loss in that way, and at the same time losing a certain amount of business through not having enough stock on hand. It requires a fairly good lot of serious thought to frame a policy that can be followed successfully now. It looks to me as though any policy and any staff should be more versatile now than at any time in the past."

### Steel Market Quiet

Prices have not been changed during the week on lines in the steel market, and the trade generally considers that the prices now named as the standards of the market will probably be continued for some time. This has not encouraged buying to any extent, although it was hardly to be expected that there should be an immediate response to the new price list.

Here is an opinion of one of the dealers in steel: "There have been a number of statements given out that the new price in steel is likely to have a very good effect on the situation. As a matter of fact many of the men who give opinions are not rendering a good service because they always try to throw some undue optimism in the future. I believe all this had the effect of keeping labor prices up. When the men in the shops or in the offices see what some of the leaders have been saying they get a false idea of their own position or of the importance of the work they are doing. I know of one case that actually occurred, where the manager of a firm that was running four days a week in order to keep the men employed over the winter gave out one of those 'going-to-be-all-right' interviews. The men in the shop and in the office at once got the idea that things were going to break all right, and the idea spread that the putting of the works on four days a week was nothing short of an injustice and an imposition on them. I think we have got to get down to production on a lower and a better basis. Labor costs must come down or I cannot see how building is going to go ahead. The steel market will recover when the labor market gets down to brass tacks, and not before," was his concluding remark.

### The Scrap Metal Market

The waste material markets in Canada have been sluggish, demand from consumers showing no quickening. Hand-to-mouth purchasing by manufacturers

## POINTS IN WEEK'S MARKETING NOTES

**Pittsburgh says that some of the mills are now running around 40 per cent. The new price list of the Corporation caused quite a tonnage to be released.**

—

**U.S. export trade in machine tools has fallen off sharply. They are meeting very sharp competition from other countries.**

—

**May Day passed with few strikes in the metal working industries. Leaders say it is due to the amount of unemployment in these lines.**

—

**Montreal warehouses have named a price of 3.75 on bar iron and steel.**

—

**Structural steel should be moving much better were there going to be an improvement in building operations.**

—

**The scrap market is still very much down. Dealers could probably make contracts at present prices but it would be difficult to get the material with which to fill these contracts.**

has been all that has been done, and most waste material dealers do not look for any immediate improvement in the situation. Most guesses are that it will be yet a month before industry in general will begin to move at a normal pace. Signs of expansion in operations have not been lacking, but most manufacturers seem to be using up such raw material as they have on hand.

In scrap iron and steel Toronto dealers report no change. The tendency of prices has been easy despite the better outlook resulting from the disposition of steel products prices to stabilize around the new levels announced recently by the United States Steel Corporation. Excepting in scrap, few transactions have been reported. Most holders of scrap are waiting for higher prices on open-hearth and rolling mill scrap, and not pressing for business.

The consumption of metal products in the Dominion and in the States is reported to be steadily expanding, but scrap dealers in Toronto have not done any business to speak of. Small lots of scrap grades have been called for. Prices are rather firm at last quoted levels. Generally dealers state they are not being offered much scrap and that their supplies are relatively light.

# PITTSBURGH STEEL MARKET IS BOTH STEADY AND VERY QUIET NOW

Special to CANADIAN MACHINERY

PITTSBURGH, May 5.—The steel market situation might be summed up very briefly by saying that the market is very steady and also extremely quiet. As to steadiness, the prices recently developed are being strictly maintained, and while in pre-war times that was not an unusual but rather the usual condition, it has not been so usual since the war, since for two-thirds or three-fourths of the time the independent and Steel Corporation prices have been different, the independents being usually either above or below the Corporation. That is the better way to put it, rather than to say that the Steel Corporation has been above or below the independent prices, since it is the independent prices that have done nearly all the fluctuating.

Already there is some speculation in trade circles as to whether or not the independents will cut the prices they have lately adopted. Just now the various producers strongly assert that they will not, because they cannot afford to, but it was only last November they stopped saying they could not sell at the Industrial Board prices, while about the beginning of February they began to cut those prices. The unit cost of production is very high, on account of poor distribution of overhead with the present light operations, but an individual mill might figure that if it secured additional business, furnishing a more economical operation, it could thus afford to sell at a lower price. As to the Steel Corporation making any further reductions, the Steel Corporation's general policy is well understood. The Corporation would reduce its prices if thereby a broader consuming market for steel could be developed, but it is plain that this could not be done at present or in the near future. There is a very strong probability that steel prices will be reduced readily when a latent demand develops large enough to give the steel industry reasonably full employment, but no one expects such a condition to develop in the near future. There are possibilities of it for next September or October, but the common view in the steel trade is that there will be no really heavy demand before next year. A heavy demand would be a demand more than 50 per cent. greater than the present demand, which is running, at long range view, at about 40 per cent. of capacity.

### Quiet Market

The Steel Corporation is undoubtedly receiving more business than formerly, or since it reduced its prices, this carrying with it a modification of contracts. The Corporation's customers are naturally more disposed to specify now than a few weeks ago, when the cost was higher than prices that could be done with independents. However, the increase in the Steel Corporation's specifications is perhaps not altogether as great as might have been expected to result from the change in prices.

This Steel Corporation business, however, does not appear in the open market, being simply in the form of specifications against old contracts. In the open market there is very little business. No new or increased wants have arisen, and the volume of business being booked by independents is particularly small now, as is naturally to be expected from the circumstance that customers of independents closed rather freely at the time when the independents were withdrawing their former quotations in favor of the advanced prices they are now adhering to, and to which the Steel Corporation reduced.

### Steel Prices

The following quotations, developed in the readjustment that fell approximately within the period April 8 to April 15 still rule: Billets, $37; slabs, $38; sheet bars and small billets, $39; rods, $48; bars, 2.10c; shapes, 2.20c; plates, 2.20c; hoops and hot rolled strip, 2.75c; cold rolled strip, 5.50c; plain wire, 3c; wire nails, $3.25; standard steel pipe, 62½ per cent. basing discount; blue annealed sheets, 3.10c; black sheets, 4c; galvanized sheets, 5c; tin plate, $6.25.

In manufactured steel products there were some changes in the past week. At first, in the readjustment, some spike makers, as noted in last week's report, set standard spikes at 3.30c, small spikes at higher base prices and boat and barge spikes at 3.85c. Then the Illinois Steel Co. and Inland Steel Co. put out a uniform base price of 3.40c applicable to all spikes, subject to extras in the list used during the war control, and the other spike makers are disposed to use this price basis when in competition, but some of them assert that they will not do it regularly.

Last week's quotation on chain, 6.35c, was based on the quotation of one producer, who had reduced from 6.75c. The other producers have since reduced from 6.75c to 6.25c, base, at the same time decreasing the advances on ½-inch and smaller by a quarter cent.

### Operations

The Steel Corporation has probably a slightly heavier operation now than at its low point about three weeks ago, when the rate was scarcely 40 per cent. of capacity. The independents are doing better, probably operating at 40 per cent. or more. In January the Steel Corporation operated at about 90 per cent. and the independents at about 30 per cent.

### Pig Iron and Coke

Foundry iron is easier. While some producers are still quoting $25, valley, and state they are picking up small orders from regular customers, one producer has gone to $24.50 and it is possible $24 might be done, the price at any rate being quoted by some middlemen, perhaps on resale iron.

Merchant furnaces that were holding basic iron at $25 have withdrawn the figure and have no open quotation. When any worth while inquiry develops they will decide what to quote. A steel works interest that sold over a month ago at $23 has gone up to $25. Lower sellers remain, and the question just now is whether they will develop enough competition with each other to do $22 or less, or will withdraw on account of other producers having gone up, and with the idea of giving the steel market some sentimental support. One valley steel interest has sold several small lots of basic iron at intervals at $22.50, while a Canton interest states it was quoted as low as $22 on its recent inquiry for 10,000 tons for May. No purchase was made as the company will blow in its own furnace instead, probably because it has a by-product coke plant that would make the operation more economical than that of a furnace selling pig iron at $22 and buying Connellsville coke. The question is whether the $22 quotation made for Canton was from Weirton, valley or Cleveland, as the three points have the same freight to Canton, $1.96.

Connellsville furnace coke shows quite a range. Sales three weeks ago were at $3.50, while since then coke has sold both lower and higher, at $3.25 or $3.30 and at $3.75, possibly at $3.90. It is

unusual for there to be such a spread. Some furnaces believe they could buy at $3 if they could offer a good tonnage, sufficient to operate a coke plant economically. As it is, most coke producers keep their plants idle as there is less loss in that than in running to produce the very small quantities for which orders could be secured. Spot foundry coke remains at $5 to $5.50.

## NEW YORK SEES NO IMPROVEMENT

**Booking Going to the Mills Is Small—Bidding Hard to Secure Export Business**

Special to CANADIAN MACHINERY

NEW YORK, May 4.—Despite the fact that machine tool business is showing no improvement, prospects continue to multiply, indications that some buying may be done when the psychological time for business resumption has arrived. Undoubtedly there is an improvement in the general situation, but it is extremely slow and there is nothing in sight yet to indicate the speedy revival that has frequently followed business depressions of the past.

Much of the business in machine tools now being talked of is for export. The Japanese Government has a list of machines on which it is getting bids both here and in England. It is reported that only a dozen or so of the machines will be bought in the United States. The South Manchurian Railway is doing a little buying here, and an inquiry for China is in the hands of Dowler, Forbes & Co., an export house, with English connections. Another export house has a list of about twenty machines for the Argentine, but it is not known whether purchasing may be expected within the near future.

Some of the large manufacturing companies in the East are known to be figuring on large lists of shop equipment, but it is clearly stated that no buying will be done at present, and the lists are merely being prepared in a time of quiet so that they will be in readiness to buy as soon as business stability is restored.

Machine tool builders are booking very little business. Many of the plants are operating at 10 per cent. or less. The dullness of business was directly responsible for the cancellation of the spring meeting of the National Machine Tool Builders' Association, which was to have been held at Atlantic City May 19 and 20. There is a bare possibility that a meeting may be called for June if business picks up.

## Scrap Metal

The scrap market in some centres shows better demand, with somewhat higher quotations, but speculative considerations are a factor.

All dealers would like to pick up some cheap material for throwing down in their yards, but they have not been especially successful for the reason that the disposition of producers has been to let the material accumulate rather than sell it at the prices which have been offered. It is very doubtful if heavy melting steel could be bought for less than $15 per gross ton, delivered, on the Pittsburgh market.

The transactions on the New York market are so few that it is difficult to determine actual prices. The only inquiry of interest during the past week was that of the Bethlehem Steel Co. for from 25,000 to 30,000 tons of heavy melting steel at $11 per ton, delivered. Some dealers consider it doubtful if sucn a large tonnage can be obtained at present for this price.

Though a better feeling is evident on the Buffalo market, sales do not bear out the feeling. One buyer claims to have been offered by Pennsylvania dealers locomotive grate bars delivered to his yard near Buffalo at $13.50 per gross ton. Car wheel prices are down $1 per ton. A sale of 2,000 tons of heavy melting steel was made recently at $13.

As a result of several mills coming into the market there was considerable revival of activity in the scrap market at Cleveland during the week. A Cleveland mill purchased 3,500 tons of shoveling turnings at $8.50. A Canton mill is again accepting shipments which it had held up for several months. As a result of buying by mills, there is some demand from dealers for heavy melting steel at $13 for Youngstown delivery.

On the Chicago market dealers in anticipation of better demand are bidding against each other for railroad material which they are stocking in their yards, and present buying prices on a number of commodities have advanced under the stimulus of speculative purchases.

## Pig Iron Market

The outstanding feature of the pig iron market at Pittsburgh, has been the abandonment by merchant producers of the steel making grades of their recent price position which involved quotations of $25, furnace, for basic and $27, furnace, for Bessemer, and a refusal to consider less on the ground that these prices represented costs. These interests have no fixed quotation now, and are ready to consider bids.

Sales, on the New York market, have been limited to small lots, but the feeling in the market is somewhat improved. Foundrymen report a slow but encouraging increase in their melt and the settlement of the wage controversy by the Stove Founders' National Defence Association gives rise to the belief that many strikes now pending may be adjusted on an equitable basis, and that the demand for pig iron will increase.

On the Boston market the activity centres in Pennsylvania iron. One lot of 1,000 tons of No. 2X was sold this week by an eastern Pennsylvania furnace to a Massachusetts consumer. It is intimated that the price was around $24, furnace, but the terms are confidential.

A few more foundry pig iron consumers are showing an inclination to buy for two or three months ahead on the Philadelphia market, but sellers are discouraging such business. One furnace declined to accept an order for May-June-July shipment, its present quotations holding good only for delivery within thirty days.

A Cleveland automobile foundry has released shipping orders for 2,000 tons of foundry iron per month; a steel plant has released 5,000 to 6,000 tons per month, and a Michigan automobile foundry has released four or five carloads a week, this being the first iron this foundry has taken in several months.

Conditions in foundries in the Chicago district are slowly but steadily improving. Contracts for automobile castings are being let and while this work is not evenly distributed it has been reflected in a fair number of orders for pig iron for prompt shipment.

## FARM MACHINERY MARKET IS FLAT

**Explanation Given At Harvester Plant In Hamilton for Closing Down the Works**

In a recent edition of the International Harvester's Bulletin is the report of A. H. Young, manager of the International relations, showing why it is necessary to close down for the present. Mr. Young stated that the present rate of exchange, and the extreme poverty of European countries have operated to completely cut off export trade, which amounts to 50 per cent. of the Harvester business. The tremendous reduction in the price of farm products, the large sums spent for high priced seed and labor last year, has made the farmer unwilling to sell at the present greatly reduced prices. They simply cannot buy new machines at their present high cost; and not only that—they are organizing and say they are not going to buy until the I. H. C. and other makers have reduced their prices, so that our domestic trade has also fallen flat, and therefore our manufacturing program for the future is not encouraging.

The death occurred at Gananoque on May 2 of David Bain, general superintendent of the Ontario Steel Products Co. Thirty-five years ago he entered the Axle Company as foreman, and remained with it until it was merged in the Ontario Steel Products Co., becoming its general superintendent. Mr. Bain has been a resident of Gananoque for more than forty years, coming there as a machinist from Carleton Place to enter the company of his cousin, the late George Gillies.

GALT, ONT.

# Do Your Castings Cost Too Much?

A rearrangement of your patterns might cut their cost 25 per cent.; a different method of molding them might double your production at no increase in molding cost. We can advise you and we have expert metal and wood patternmakers who are able to make any changes that may commend themselves to you.

## If you need some new Patterns

send us a sample, blueprint or sketch, and ask for our advice. It won't cost you anything. If our advice is good and commends itself to you, it is only fair to assume that our work will be equally satisfactory, and we need the work as badly as you need the patterns.

We are in a position to do turning, boring, drilling or other semi-finishing operations on castings supplied by us. Ask us.

***We have for our and your requirements, a large stock of assorted White Iron Stars, suitable for light agricultural to medium weight machinery castings, while they last, at 8 cents per lb. F. O. B. Galt.***

# Apprentice Should Have an Education

## Many of The Boys Who Go Into The Business Do Not Seem to Understand That There is Real Study and Work Before the Status of a Real Machinist Can Be Attained

By CECIL H. SMITH

REAMS of paper have been used in the attempt to describe an ideal method of making machinists, but so far no method has been discovered that will produce a good mechanic out of every apprentice. Conditions being equal, the apprentice system is far superior to the breaking in of handy men. True, success has been attained in many instances through the using of mechanically inclined handy men, but had these same men served an apprenticeship in their younger days, they would have had a wider usefulness and been more independent.

Conditions during the past few years have changed to such an extent that the old-fashioned, all-round machinist is almost a thing of the past. While some of the larger plants have organized part time schools to supplement the work of the shop, there has been very little accomplished by the average shop in Canada to make the most of their apprentices. To my mind co-operation between the manufacturer and the boys will accomplish a great deal, and following are a few suggestions which I believe could be followed out to good advantage.

### The Plant's Reputation

When employers begin to regard the making of their mechanics as equally important with the quality of their product, then we will secure better all-round machinists who will be a credit to the trade. A machinist developed and trained in a shop is as much the product of that plant as the rest of the machine tool equipment. The class of mechanic turned out will, to a large extent, give the firm a good or indifferent reputation. I remember a case in point. A mechanic was applying for a position in Winnipeg. On being asked where he served his time, he named a certain plant in Ontario. "Oh, that's where you come from? — well, consider yourself engaged." This is not an imaginary incident, and it proves what I firmly believe, viz., that reputation goes a long way.

### Care Necessary in Getting Boys

Great care should be exercised in selecting material for mechanics. To my mind the boy should be at least sixteen years of age, have an entrance certificate, and give some good reason for wishing to become a machinist. After a few months' trial, a stock taking should take place to ascertain whether he is still anxious to be a mechanic, also if he appears to have it in him to become a machinist. Many a boy wants to be a machinist who never will become worth while as he is not suited to the business. Six months or even less should clearly demonstrate his fitness.

The chief failing that seems to exist amongst boys is that they cannot see the necessity of absorbing everything mechanical within their reach. They seem to imagine that four years in any machine shop automatically makes them a machinist, just the same as a tap will make a thread, without any effort on the part of the tap itself.

If manufacturers were to call in their apprentices to-morrow, asking them if they read the various magazines pertaining to their trade, I feel sure the answers would both surprise and disappoint them. This, in spite of the fact that such magazines can be perused free at any public library. Enter any library to-day and you will find that 90 per cent. of the men who are reading such journals are the ones holding responsible positions.

### Must Have Better Education

It is my contention that the boys should be told of the need of getting this education. Ask them questions they should be able to answer, then if they cannot answer them tell them where they can obtain the information. Give them a periodical examination, one that can be prepared by the superintendent or foreman. Find out if they can calculate gearing, how to cut tapers, the principles of threading, etc. Get the fundamentals thoroughly instilled, and you need have no fear of the future of your machine shop.

On the other hand the boys should do their part in making good tradesmen of themselves, and a few suggestions from one who has passed through the mill might not be amiss. Do not be afraid of producing too much work, or doing tasks you consider beneath your dignity. It is very seldom that the right type of boy is imposed on. Use discretion in asking questions, but ask enough so that you will know WHY you are doing a piece of work in some certain manner. Think ahead, and plan your moves ahead. Do not imagine the foreman is not aware you are loafing, simply because he hasn't caught you flat-footed at it. He may say nothing about it, but that is no true sign. Perhaps it's a sign he has lost all interest in you through your own laziness.

About as good advice as I can offer is this: "Use the same enthusiasm at your work as you do in your sports. Do not let the other fellow beat you; keep ahead, not by a spurt now and then, but by consistent application to the trade you have chosen as a life work."

## PROVINCE BUILDS CEMENT PLANT

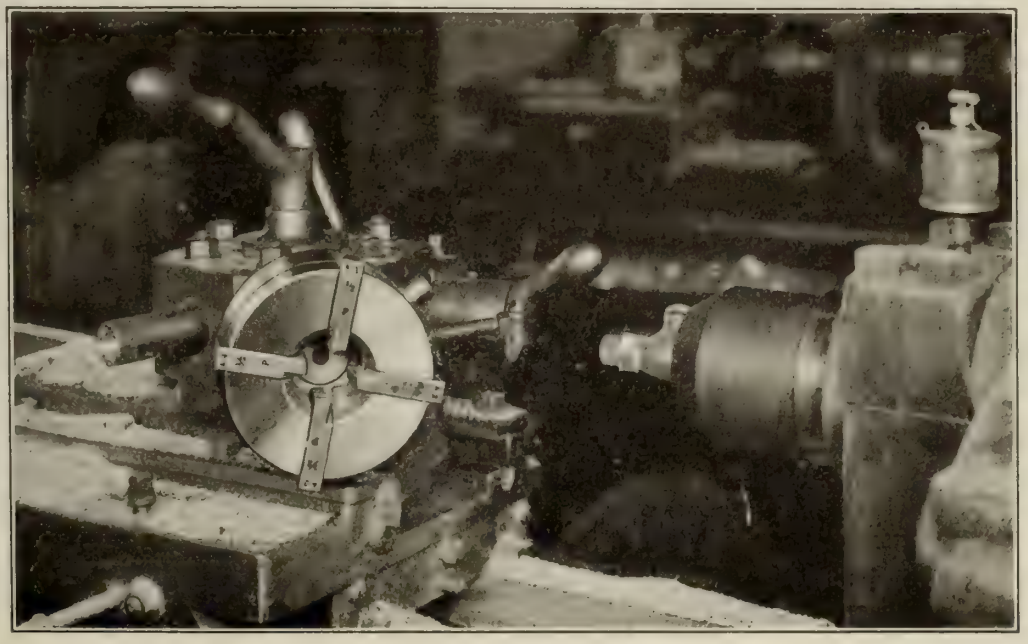
### Believes It Can Turn Out the Required Supply at Price Below Market

The Ontario Legislature in committee of supply on the estimates approved of a vote of $1,000,000 for the carrying out of Hon. F. C. Biggs' scheme to establish a provincial cement plant. The Minister explained that the amount voted would build a one-unit plant with a capacity of something over 300,000 barrels annually, which would be sufficient to supply the needs of the province for its provincial highway program. He stated the location of the plant had not been decided upon, but that the department was negotiating for options on alternative sites. It was expected that the province would be able to produce cement at prices much below those prevailing, and moreover would be assured of an adequate supply instead of having its work held up by difficulty in getting delivery.

## PORT ARTHUR STACK SOLD FOR MILLION

### Report Says Development Work Will Be Carried On in That District

Sudbury.—A great deal of talk has been heard in the north about the development of the iron ore industry, but the first important step in that direction has just been taken, with the announcement that the Port Arthur blast furnaces have been sold for the sum of $1,000,000.



American interests are said to have concluded the deal. The terms call for the purchasers to pay $200,000 within four years, and, if at the end of that period they decide to continue, the balance shall be paid, half of it as cash. The deal must secure the endorsation of the people of Port Arthur. The large plant has been standing idle since 1912.

It was only recently that the Atikokan mine was optioned but it is said that the two deals have no connection.

Mackenzie and Mann interests built the furnace in 1905 and operated it seven years. When operations resume 200 men will be employed.

Right in the Lead

# A Busy Corner Of A Notably Successful Shop

The Geometric Die Head illustrated has just cut the ½-in. pipe thread on the bibb shown. The equipment of this shop consists of many standard and special Geometric Tools.

These people express themselves as very strong for the Geometric line, and are always glad to recommend the use of these Tools. They have themselves used Geometrics for a great many years.

If you can find a user of Geometric Screw Cutting Tools who is not satisfied with them, you will do us a great favor by telling us who he is and where we can find him.

# INDUSTRIAL NEWS

## NEW SHOPS, TENDERS AND CONTRACTS PERSONAL AND TRADE NOTES

### TRADE GOSSIP

**Want Black Pipe.**—Vineland Canners, Ltd., Vineland Station, Ont., want to know where they can secure a used steam heating system for a building 60 feet by 120 feet, or about 500 feet of used black iron pipe.

**Wants Equipment.** — L. R. Reynolds, Tramping Lake, Sask., wants to secure a lathe, drill press and cylinder boring machine.

**Used Mill Wanted.**—James Cunningham, 34 Brock Avenue, Montreal West, is in the market for a used ball mill, and tube mill, and would be pleased to receive particulars of same.

**Wants Garage Equipment.** — Norman Demaine, of Ashworth, Ont., wants to secure some garage equipment as soon as possible.

**Garage Equipment.**—D. L. Ancoin, 3187 Henri Julien, Montreal, is in the market for garage equipment, such as a drill press, air compressor and tank, two vises, forge blower and anvil 150 pounds, grinder, countershaft, shafting, hangers, pulleys, etc.

**Buying Fire Equipment.**—The Board of Control of Toronto is asking tenders up to May 23 for the following: One combination hose and chemical motor truck; one 75-foot aerial ladder truck, front chain drive, with tiller, gasoline driven; four automobile triple combination pumping engine, hose and chemical wagons, pumping capacity 800 Imperial gallons per minute.

**Running Full Time.** — Announcement was made by Wallace R. Campbell, secretary-treasurer of the Ford Motor Co. of Canada, that the main factory of the company at Ford, Ont., will start work on full time basis. The factory for the last few months has been working but four days a week.

**Cancel Convention**—The National Machine Tool Builders' Association announces that its spring convention, scheduled for May 19 and 20 at Atlantic City, N.J., is cancelled. The triple convention of the American Supply and Machinery Manufacturers' Asociation, the National Supply and Machinery Dealers' Association and the Southern Supply and Machinery Dealers' Association will be held on May 16, 17 and 18, as planned, it having been erroneously reported that this convention also would be cancelled.

**Conditions Better.**—Employment conditions in Sudbury district have loosened up to a great extent during the past week and for the first time since last summer a severe shortage of unskilled labor is reported by the employment bureau. Registrations are not falling off appreciably, however, and the men are snapped up as soon as they apply. There is a big demand for river drivers. The pay this year is from $2 to $3 a day with free board and lodging. General unskilled labor is also scarce, the pay for this class of work being from 30 to 35 cents an hour, the working day being from 8 to 10 hours.

**Secure Contract.**—The Canada Car & Foundry Co., Ltd., of Montreal, has received the contract from the Toronto Transportation Commission for 100 motor cars and 60 trailer cars. The contract price is approximately $1,270,000 and is exclusive of electrical and air-brake equipment, for which prices are now being received by the Commission. H. H. Couzens, general manager, Toronto Transportation Commission.

**Should Be Standard.**—Canadian consumers are getting less coal and more dirt in what they purchase during recent years, according to J. C. Hurcomb, of the C. C. Ray Co., Ottawa, coal merchants, who was examined by the special House Committee on fuel supplies. Mr. Hurcomb believed there should be a Government standard of quality for coal and producers should be required to supply coal to that standard.

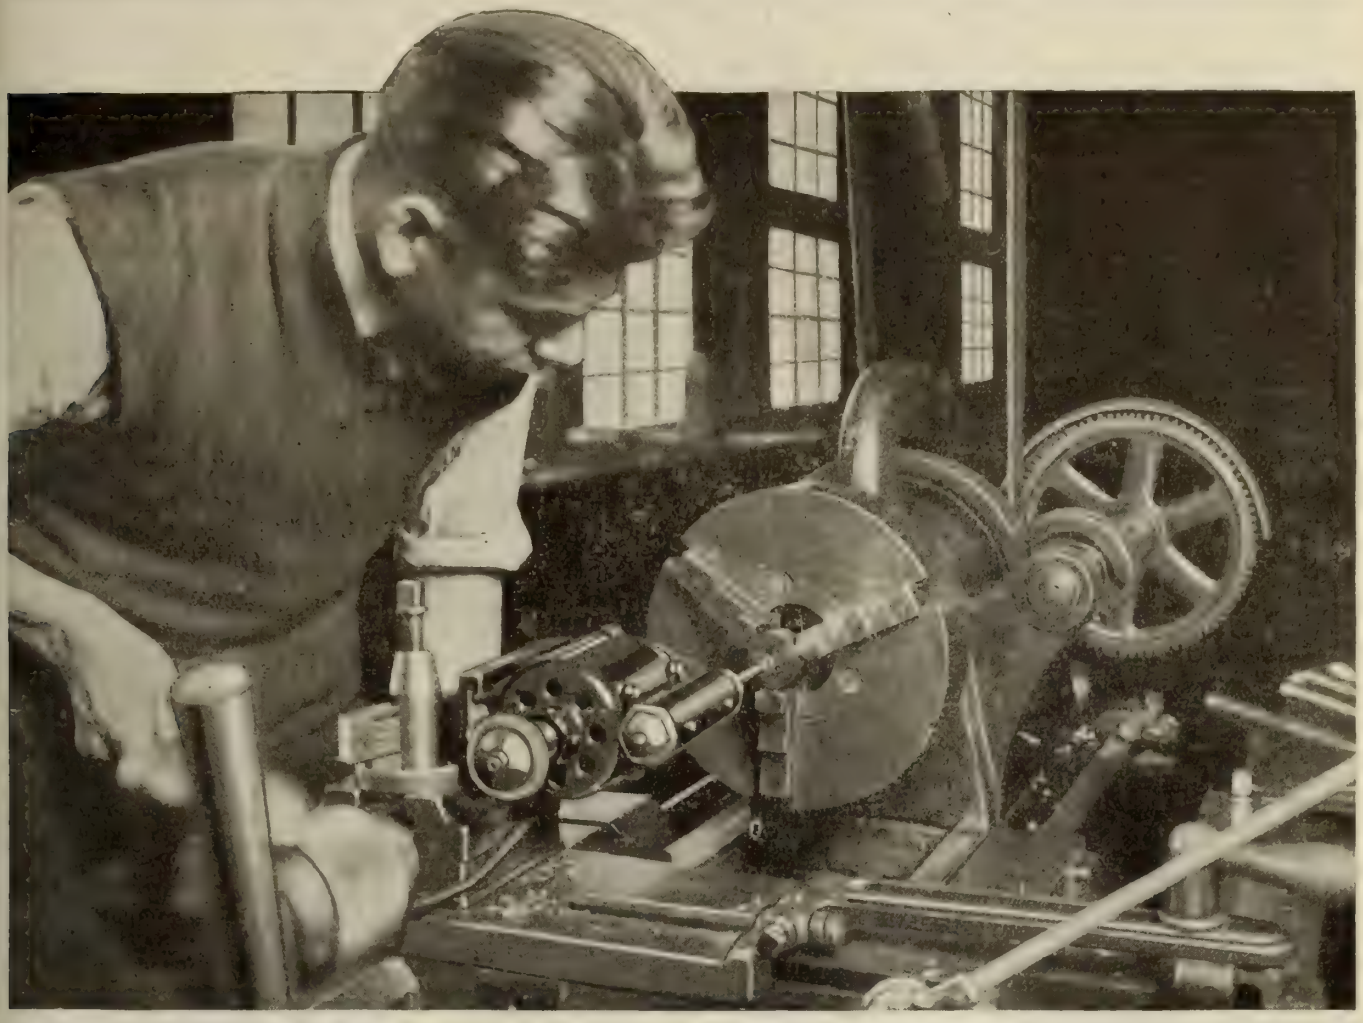
**Russian Trade.** — Brantford agricultural implement firms would not be adverse to trade with Russia, providing that financial arrangements were satisfactory, according to Mayor George Wedlake, vice-president and general manager of the Cockshutt Plow Co., commenting on the reported visit of M. Krassin, Soviet representative, to Canada, as has been announced. He added that a trade commissioner from Russia had been a visitor in Brantford recently, but nothing definite resulted. Soviet Russia offered a big field for agricultural implements, and the need there was great, while if trade with Russia were reopened it would mean a big thing for the agricultural implement industry and aid considerably in reviving it.

The Sidney Roofing & Paper Co., Sidney, B.C., will rebuild their plant which was destroyed by recent fire.

Yorkton Steel & Machinery, Ltd., are preparing plans for foundry.

If satisfactory agreement can be reached with the city officials, the Imperial Oil, Ltd., will build a wharf costing $100,000 at Confederation Street, Sarnia, Ont. The company requests the city to surrender a lease on certain land required.

The plant of the Ideal Vulcanizing Co., Belleville, Ont., was destroyed by fire on April 29. George Deline, the manager, was repairing a tube and gasoline took fire. The stock of tires and accessories owned by the company was badly damaged, and no insurance was carried on the stock.



## SHOW THAT THEY WANT BUSINESS

### How One Dealer Sizes Up the Attitude of Some of the American Firms

"If American firms want to secure business in the machine tool field in Canada, they must do two things. First, they must make up their minds that they want the business that is going here, and in the second place they must prepare to go out and get it."

That is part of the conversation that took place between a Chicago man and a dealer in machine tools in Toronto.

He continued: "Too often in the past the American firm has taken it for granted that he could ship up some of his surplus and get rid of it in this country, and that attitude has resulted in the dealer here not getting the support and the backing that he should receive. There has been a very marked change in this attitude in the last three months, and it is not very hard to see the reason. Business is needed and badly needed, and right now we are getting supplied with data and up-to-the-minute information that we could never get before, and we also have promises of more advertising assistance in getting the lines better known to the trade. The Canadian market is well worth while, but it has to be studied and followed up closely to secure success."

# Grinding Diameters on Ring Gages to Close Limits

In the Terry Turbine Company of Hartford, Conn., Dumore Grinders are used on jobs where accuracy is of the utmost importance.

The job shown here is a special Gage—diameter .750-in. with plus or minus limits of .0002 in. Because the Dumore grinds to extremely close limits it is just the tool for work of this character. Besides, the ease with which it can be set up for service wherever necessary gives it an advantage over other methods of handling many kinds of work.

Dumore Grinders can be used anywhere, taking their power from the nearest lamp socket; extremely simple and durable, they offer an economical method for accurately finishing work without changing the setting.

See the Dumore at work. Ask a man who uses one. Or have your dealer give you a demonstration.

# SCHWAB SAYS LABOR COSTS ARE THE DETERMINING FACTOR JUST NOW

New York.—Germany, through economy and sacrifices of her working people, has settled down to real production, and is outstripping the United States and allied nations in the fight toward normalcy, Charles M. Schwab declared here in an address before the Chamber of Commerce of the State of New York.

"Germany to-day can put a ton of steel in England at a price $20 a ton cheaper than England can make it," he said, "and is selling pneumatic tools in Detroit, where formerly we shipped such machinery to Germany and sold it cheaper than she could make it.

"The difference is solely a matter of labor costs.

### Idle Workers in U. S.

"It is estimated that 5,000,000 men are out of work in this country. It is accordingly of supreme importance to the working man as well as to the capitalist to restore our prosperity.

"Never before was the need for products so great, never before was such valuable producing machinery and facility available, never before was there so much that needed to be done.

"I have just returned from Europe, and I came with renewed admiration for the courage, the enterprise, the determination displayed in Italy, Belgium, France and England. Germany was ahead of all of them in production.

### Germany May Win by Labor

"Is it possible that, after having won the war, we of the allied nations, with everything in our hands, will allow Germany to win the peace through the efforts of her labor?

"Labor, on the whole, can be paid only what labor as a whole earns, and if some sections of labor exact more than their share of the current product of the world, other sections are going to suffer. I understand that our railroads to-day pay to labor over 60 cents out of every dollar received. The labor cost of making a ton of steel to-day is 85 cents out of each dollar of total cost.

### Basis of Prosperity

"In so far as our people in America are prepared to go to work at reasonable wages, in so far as we are prepared quickly to abandon the artificial extravagances of the war, will we lay the foundations for a new prosperity such as we have never enjoyed before.

"This is the route through which not merely America but the peoples of our allies can find their way out, and triumph in peace as they did in war."

# MONTREAL NOTES

The Montreal offices of the Canuck Supply Company, formerly located at 416 St. James Street, have been removed to more commodious quarters at 371 Aqueduct Street.

W. J. Brown, manufacturers' agent, 117 Youville Square, Montreal, has taken the Eastern Canadian agency for R. S. Newall and Son, of Liverpool, England, manufacturers of wire rope since 1838.

The marriage took place a few days ago of Walter R. Kingsland and Miss Lorna M. Clerk. Mr. Kingsland is on the sales force of the A. R. Williams Co., Montreal.

A. H. Chase, of A. H. Chase & Co., has arrived back in Montreal after a six months' touring trip in the South. This firm is now acting as distributors for the Mechanical Engineering Company of Three Rivers.

The Swedish Steel and Importing Co. are moving their offices from 137 McGill Street to 170 McGill Street, where they have taken over the entire fourth floor of the building. They are contemplating extension to their present activities.

On the occasion of his recent marriage Mr. Charles Bulley, educational instructor of apprentices at the Angus shops of the C. P. R., was presented with a beautifully engraved gold watch by the apprentices of the different departments, in appreciation of the great interest he had always taken in advancing the learning of the boys under his charge. Mr. C. Kyle, supervisor of apprentices, presided at the meeting.

The Blashill Wire Machinery Co., of Montreal, are in the market for a portable electric welder capable of handling the work of butt welding wire up to and including No. 9 gauge. This firm has vacated the ground floor of No. 307 St. James Street and taken offices upstairs in the same building. They expect to be making wire fencing in a very short time, construction operations taking place at their Shearer Street plant.

The last construction order now on the books of the Canadian Vickers Company will be completed before the close of the present month. Wednesday of next week has been set aside for the launching of the Norwegian cargo vessel, "Topdalsfjord," a sister ship to the Idefjord which was placed in the water a couple of weeks ago. When this vessel has been completed it will end the building operations at this yard, unless in the meantime additional business has been secured, and in the face of the present high costs of construction and the surplus of available bottoms, this seems very unlikely. It has been reported that the Government are in the market for an ice-breaker, but nothing definite has been announced as to who will receive the contract.

The order placed with the Canadian Car and Foundry Company by the Toronto Transportation Commission for street car equipment to the extent of a million and a quarter dollars is expected to keep the plant in operation for a couple of months. Some little time will elapse before actual construction will be commenced, as it will require a few weeks to get the material together that will be required for the work. It was stated by officials of the company that the present agreement with the men will be extended during the period necessary for the completion of this contract, but at the expiration of the order the question of wages and working conditions will come up for consideration. Ordinarily the agreement with the men would terminate on the first of May, so that this car order will give an added lease of life to the employees of this plant.

A very successful working test was made last week of the two new 30,000,000 gallon electrical pumps recently installed at the low level pumping station of the Montreal water works. These pumps will be put into regular service immediately, and with the other electrical unit that has been in operation for the past two years, will deliver approximately 75,000,000 gallons daily. It may be necessary to use some of the steam units but the majority of the steam pumps will be held in reserve and used only in cases of emergency. Plans are now under way whereby the entire amount of water required for the uses of the city will be filtered. At present the filtration plant has a capacity of about 50,000,000 gallons per day, and when the new additions are installed, at a cost of about $2,000,000, it is expected that about 120,000,000 gallons will pass through the beds daily.

---

Work is being started on an $80,000 packing plant by the Mace Construction Co. for the Dumart Packing Co., Ltd., Kitchener, Ont. The Mace Construction Co. is being organized by Mr. Mace, care of Wm. F. Sparling & Co., 54 University Avenue, Toronto.

---

Steps are already being taken by the Northern Canada Power, Ltd., to help prevent a repetition of the power scarcity which prevailed last fall in the North country. At the present time a conservation dam is being erected at Kemoganissee Lake, on the Metagami River, with a view to increasing the storage water for the power. It has been stated by mining men just back from Northern Ontario that the water is exceptionally high, in fact it has never been known before to be as high as it is north of the height of land.

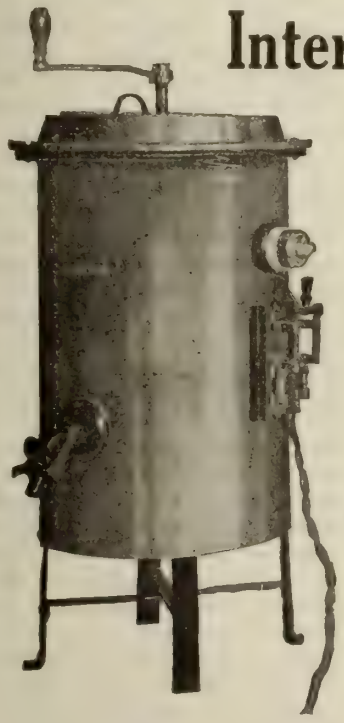
# PIPE THREADING TOOLS



***BEAVER, TOLEDO, JARDINE, OSTER***

These tools possess unusual features that result in perfect operation and the greatest economy. The taper thread is not formed by taper dies, but by a receding motion of the cutters from the pipe centres as the die advances. This is a tremendous advantage, since it eliminates friction, and with half the exertion required with a tapered die makes a thread of perfect taper equal to lathe work.

There are many more valuable and exclusive features. Let us tell you about them.

# International Electric Glue Heaters

The "International" not only keeps the glue in more perfect condition but soon saves its cost in time saved and in more economical current consumption. The one quart heater consumes only one cent's worth of current per day, while the 13 quart consumes less than the ordinary electric flat iron.

The "International" has three heats—full, medium and low. **Full** heat is used for melting. **Medium** provides a lower degree of heat for holding the glue at the correct working temperature of 145 to 150 degrees **Fahr.**, at which temperature glue has the greatest tensile or "sticking" strength. **Low** heat holds the glue at the correct temperature when it is not being used but when it is desirable to keep it hot and ready for instant use.

## NEWS OF THE C.E.S.A.

A meeting of the main committee of the Canadian Engineering Standards Association was held at Ottawa recently, Sir John Kennedy in the chair, and the following were some of the more important matters dealt with: Sir John Kennedy was re-elected chairman; Mr. T. A. Russell and Mr. H. H. Vaughan were re-elected vice-chairmen, and Dr. J. B. Porter was re-elected honorary secretary-treasurer.

The following gentlemen were welcomed as members of the main committee: Mr. J. B. Reade, Purchasing Commission of Canada; Mr. G. A. Mountain, Board of Railway Commissioners for Canada; Lt.-Col. E. W. Stedman, the Air Board; Dr. L. V. King, McGill University; Mr. T. F. Sutherland, Canadian Institute of Mining and Metallurgy.

The attendance of Mr. R. J. Durley, secretary of the conference of secretaries of national standardizing bodies in London, was approved. This conference is of an informal nature and is intended to facilitate the interchange of information and data regarding standardization, especially in its international aspect, and with regard to planning the methods of intercourse and co-operation to be adopted between the various national standardizing bodies. It is expected that the meeting will be attended by delegates from Belgium, Great Britain, Canada, France, Holland, Italy, Sweden, Switzerland, and the United States. Each secretary will present a report on the work of the conference to his committee or council on his return.

The activities of the association during the past year and the present state of the work of the various committees are briefly covered by the attached report. Among the subjects on which the association has recently been requested to take action may be mentioned the following:

A request from the Air Board has been made for the preparation of specifications for certain aircraft materials which cannot be obtained under commercial conditions in Canada, the war-time specifications of the British Air Board being much too elaborate for use under peace conditions. The necessary committees are being arranged for. Co-operation with the American engineering standards committee has been requested in connection with the aeronautical safety code, the American safety code for logging and sawmill machinery, and the American committee which is considering the standardization of parts of elevator machinery.

Requests for co-operation have also been received from the Canadian Electric Railway Association and the American Gear Manufacturers' Association.

In connection with the work of the sub-committee on Portland cement which is engaged in revising and redrafting the specification for that material originally issued by the Canadian society of

civil engineers, the main committee approved of the suggestion of the sub-committee as to the desirability of experimental work on Canadian cements with regard to the best method of determining normal consistency. The main committee also directed that arrangements should, if possible, be made with the proper authorities for the standardization of cement sieves in Canada.

### MAKING BOLTS FIT TIGHT

In connection with some work on American battleships, a report of the Bureau of Standards says it was found necessary to use bolts capable of withstanding unusually high shearing stresses. The best type of bolt for such purposes is one having a tight bearing over its entire length. The bureau was requested to devise a method by which such tight-fitting or "body-bound" bolts could be secured. Two methods were tried, both of which gave satisfactory results.

In the first case the bolts were finished a little larger than the holes in the plates. They were then immersed in liquid air until they contracted sufficiently to enter the holes quite easily. Upon warming up, the bolts expanded, gripping the plates tightly. In the second method each bolt was provided with a small hole along its axis and was finished to be an easy fit in the plates.

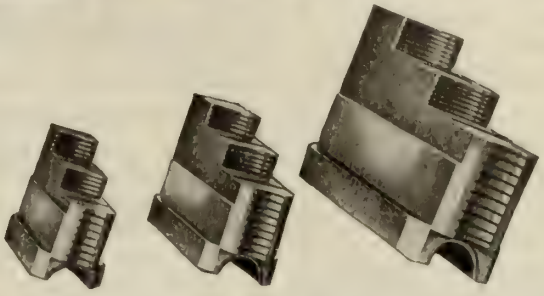
After insertion a charge of powder was exploded in the small hole. This expanded the bolt, causing it to grip the plates. Subsequent physical tests indicated that the strengths of the joints secured by both methods were sufficiently high for the purpose.

### COMPARATIVE OUTPUT OF PIG AND STEEL

The National Federation of Iron and Steel Manufacturers, London, England, has put the comparative output of pig iron and steel among the five leading countries as follows:

| | Pig iron | |
|---|---|---|
| | 1913 | 1920 |
| United States ... | 30,966,000 | 36,403,000 |
| United Kingdom. | 10,260,000 | 8,008,000 |
| Germany ..... | 19,007,000 | *7,000,000 |
| France ..... | 5,126,000 | 3,265,000 |
| Belgium ..... | 2,445,000 | 1,113,000 |
| Total . . ..... | 67,804,000 | 55,789,000 |

| | Steel | |
|---|---|---|
| | 1913 | 1920 |
| United States ... | 31,301,000 | 40,773,000 |
| United Kingdom. | 7,664,000 | 9,057,000 |
| Germany ..... | 18,648,000 | *9,000,000 |
| France ..... | 4,620,000 | 2,915,000 |
| Belgium ..... | 2,428,000 | 1,216,000 |
| Total . . ..... | 64,661,000 | 62,961,000 |



*Estimated.

The data for Germany for 1920 are stated to be a rough estimate since Germany declines to publish figures of iron and steel production.

# "The Spectre"

*By Guy Morton*

"LONGREEN was not a quibbler.

"'I am sorry, Grimley' — he came straight to the point—'but we are compelled to dispense with your services at the end of the month. Turner's for the past six months has been having a terrible pull. We got overstocked on the rising market and now, with the market falling every day and getting more and more into the customers' hands, we have to retrench or crash. We have chosen to retrench. Every stick of decorative employment is being cut out of the store. . . .'"

*What Spectre?* The Spectre of Unemployment—a spectre which all too many have encountered during the past few months. If you have not personally encountered this spectre, so graphically described in its causes and consequences by Guy Morton, you may count yourself amongst the fortunate, but there will be no doubt as to your interest in his story. If you have encountered it, nothing can stop you, once you start this story, from reading it to its unusual and constructive conclusion.

It is a great piece of fiction, told by the same author who wrote "Personality Plus" in the March 15th MACLEAN'S.

## Review of Reviews

## Ten Others

**"The Drama of our Great Forests": Life and Love Return—** *By Arthur Heming*

This is the seventh installment in Mr. Heming's wonderful account of life in our northern forests and pictures the fascination of real romance in the wilds.

**"Have Faith in Our Nationals"—** *By Agnes C. Laut*

There is no use always knocking, says Miss Laut. By a constructive policy of immigration and settlement, some of these deficits can be vastly reduced.

**"Conversation vs. Closure"—** *By J. K. Munro*

Premier Meighen is struggling against great odds to carry through some constructive legislation. According to Mr. Munro, they are really not getting anything done at Ottawa—and he tells how they do it in his masterly, pungent, pithy, witty fashion.

**"She Wasn't a 'Type' So She Became a Directress"—** *By Edith M. Cuppage*

The story of a B.C. woman who wanted to get into the movies—and got there, despite everything, in the administrative side.

**"Heads Million Dollar Corporation"—** *By Dorothy G. Bell*

The story of a Canadian girl who went to the States with an idea that she might become a dancer, but has made for herself a niche as head of a million dollar financial corporation.

**"Our Own Mediterranean"—** *By Elton Johnson*

What's what at the present time in regard to the movement which is on foot to make ocean ports of our Great Lake ports.

**"Making Good on Four Ambitions"—** *By Sinclair Laird*

The story of W. S. Bullock, a member of the Provincial Legislature of Quebec Province, who did not know his multiplication table at 19 and is now a leading educationalist.

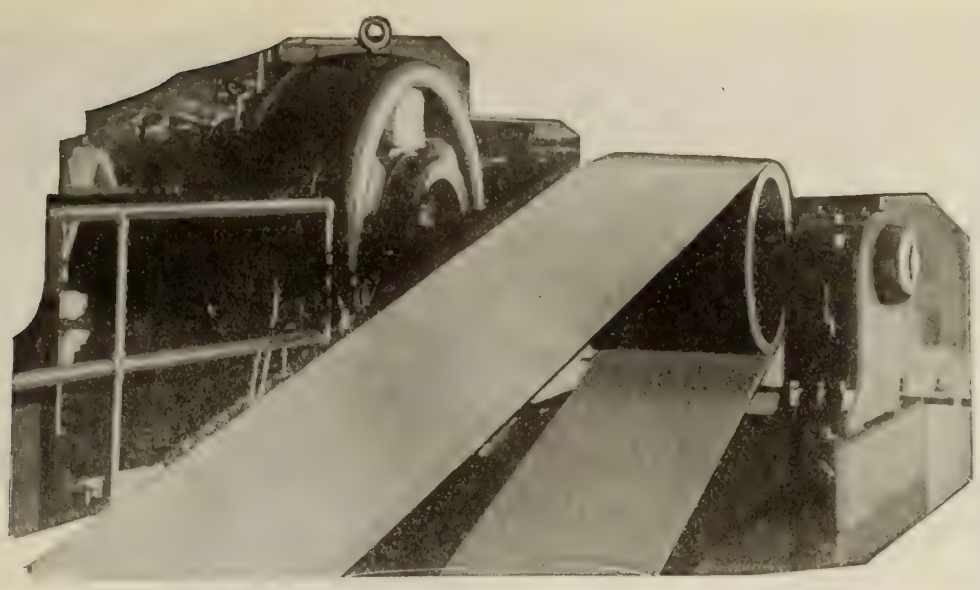
**"Pawned"—** *By Frank L. Packard*

This masterly story of a triple regeneration is drawing swiftly to its conclusion; John Bruce and Crang meet again at death-grips.

**"The Gates of Tien T'ze"—** *By Leslie Howard Gordon*

The first "gate' is entitled "The Gate of Wu" and starts off this thrilling, absorbing, melodramatic story with several full pages of gripping adventure.

**"The Cage of Iron"—** *By William Merriman Rouse*



A story of an old man who thought he could take into his own hands the vengeance which the Creator intended should be left for Himself.

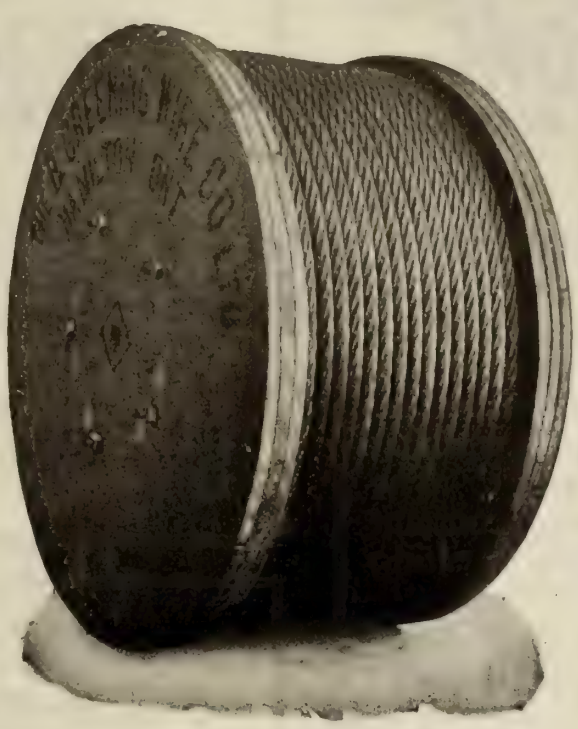
# Nichrome the Casting Durable

## Carbonizing Containers

of Cast Nichrome are at once a source of economy and an aid to quality results.

Since the very principle of carbonizing and hardening is one of quality and service, the reasons for the extensive use of Cast Nichrome Containers are obvious.



Thousands of hours of service, at 1,800 deg. F., without warping, growing, cracking or scaling means not only economy, but also uniformly good results in the heat-treated parts. Shorter heats, greater furnace capacity and less fuel are added advantages. All Cast Nichrome containers are backed up by the Cast Nichrome economy guarantee.

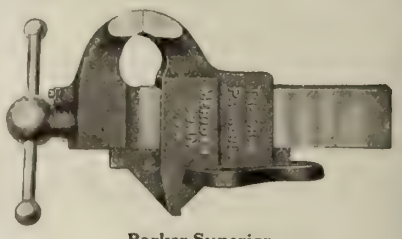
## LEARNED From Experience

WHEN *ARMSTRONG* earned his living by RUNNING A LATHE he often wished he could get a set of Lathe Dogs which would stand up to the work. The Screws especially were a constant source of trouble, points upsetting and threads stripping.

His practical experience is the basis upon which the *Armstrong* line of Dogs and Clamps is built. The bodies are Drop Forged of a special grade of steel selected for its high degree of stiffness and great tensile strength. Screws can't be beat for long lasting qualities; they are made of Chrome-Nickel Steel, given a special heat treatment, and the points are hardened.



*Specify Armstrong when ordering and get the best.*

# Built for Wear

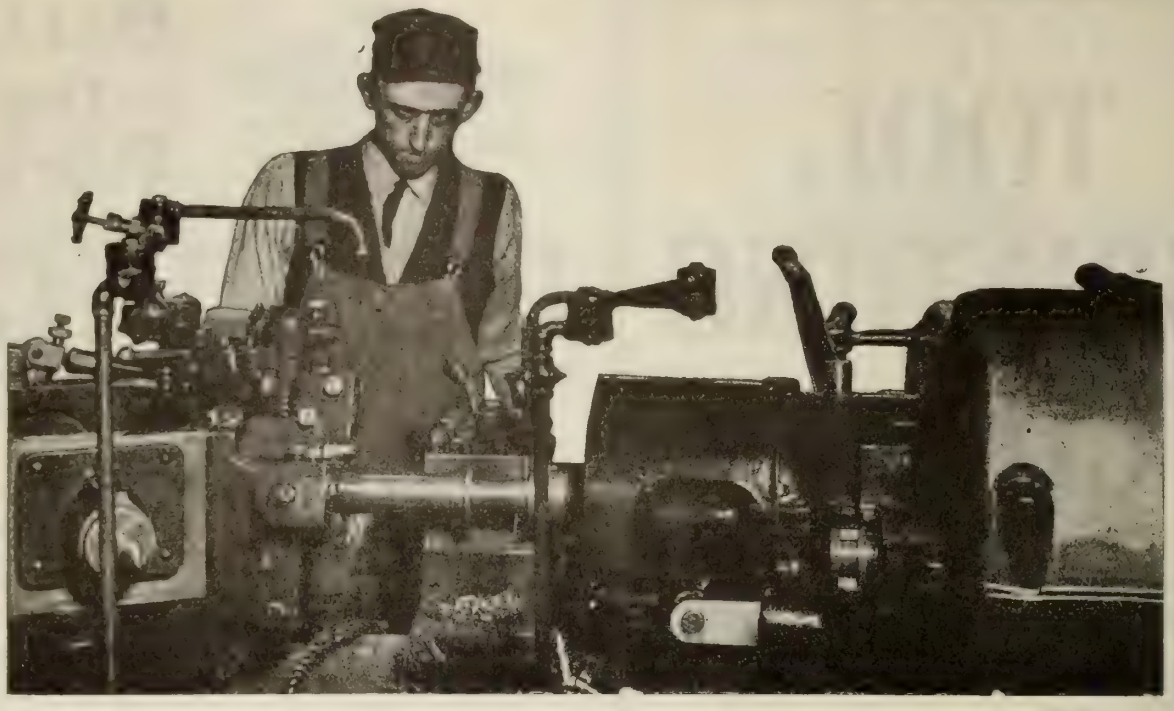
# BUSHINGS

Diamond Fibre Bushings are especially adapted for use where toughness and ability to withstand hard usage are of paramount importance. They are made in every style: flanged, tapped, threaded, countersunk, tapered, or a combination of all these styles.

Diamond Fibre is particularly suited for use in the Automotive Industry because of its imperviousness to oil and grease, its high dielectric strength, its light weight and great strength, and the ease with which it takes extreme machining.

**Some of the Many Uses Where Diamond Fibre has Proved Superior**

- Battery box linings
- Brake bands
- Bushings
- Bush rod tappets
- Clutch linings
- Conduits for wiring
- Discs
- Frictions
- Gaskets
- Insulation
- Packings
- Speedometer gears
- Starting crank handles
- Switch handles
- Timer rings
- Transmission handles
- Washers
- Wire manifolds
- Parts for starting, lighting and ignition systems.



We are fully equipped to take care of special shapes made to your specifications for any article you desire, or can supply the basic material in sheets, tubes, or rods.

*We will be glad to advise you on any production problem that is bothering you. Our engineers and experts are at your service. Send for our new illustrated catalogue about Diamond Fibre and its uses.*

# To Decrease Operating Costs

The side carriage is an important part of the W.&S. turret lathe. It reduces operating costs, often by as much as one-half. It operates simultaneously with the turret and independently of it. The side carriage has a separate feed rod.

Take some of the simplest bar jobs; by cutting off with the side carriage while the turret tools are finishing their work, you save most of the cutting off time.

Here is the picture of a W.&S. 2-A in a railroad shop. This machine makes bolts, pins, oil cups, valve parts, piston rods, and many other parts used in the repair of locomotives and cars.

On all these parts both turrets operate together.

Take this feature and the fact that the machine operates easily and accurately, and you know why the machine is popular with the shop men. It delivers the goods.

Send us blue prints of your parts and we'll tell you how long it will take to do your work the W.&S. Way.

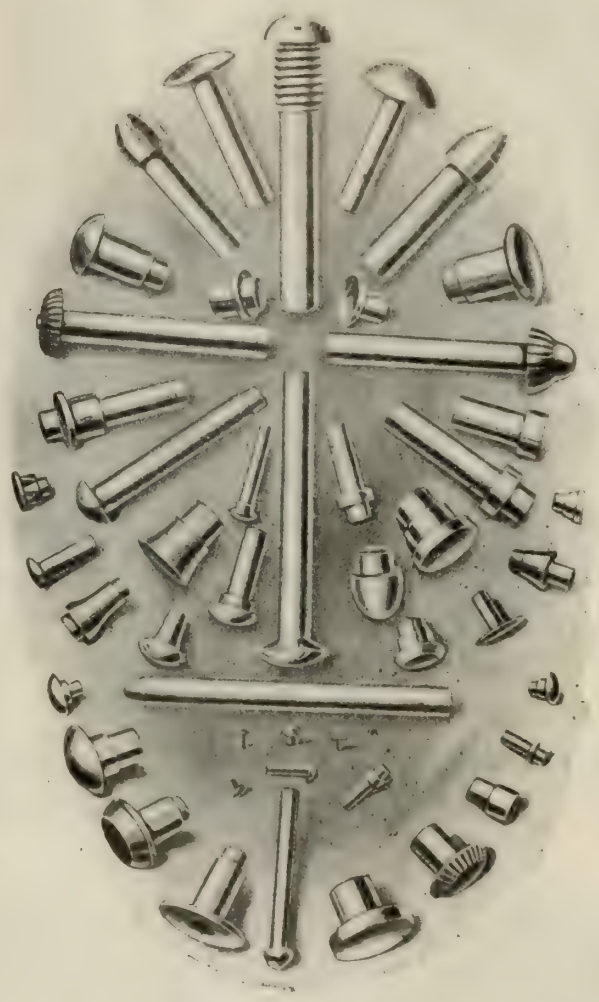
MACHINE SCREWS

## Cut Down the Work on Your Screw Machines



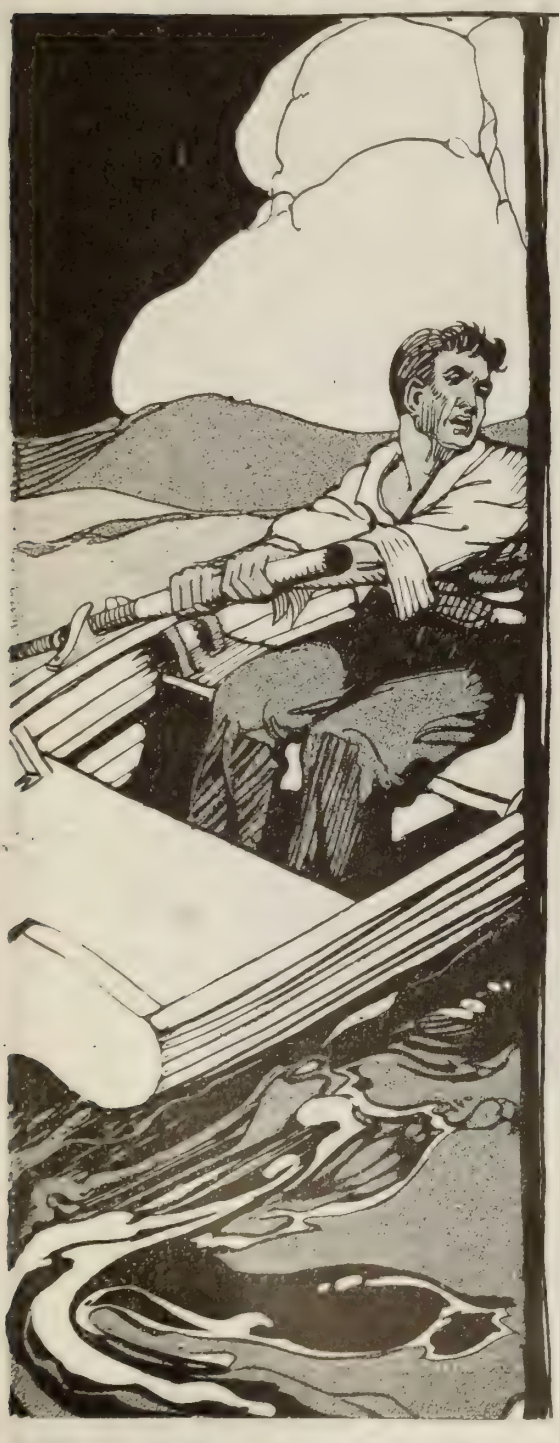
NATURALLY you want to reduce your manufacturing costs in every way you can.

A great many parts now made on screw machines can be produced by our process at a great saving in cost.

And back of every order sent to this company is an enviable reputation for products superior in quality and workmanship.

In addition to our standard line of machine screws we manufacture special sizes and styles to order when required.

We also manufacture special parts, after the style herewith illustrated, upon receipt of samples. All kinds of high-grade Rivets, from Brass, Copper, Steel, German Silver and Aluminum—to order only.



**These are but a few of the many parts we frequently make.**

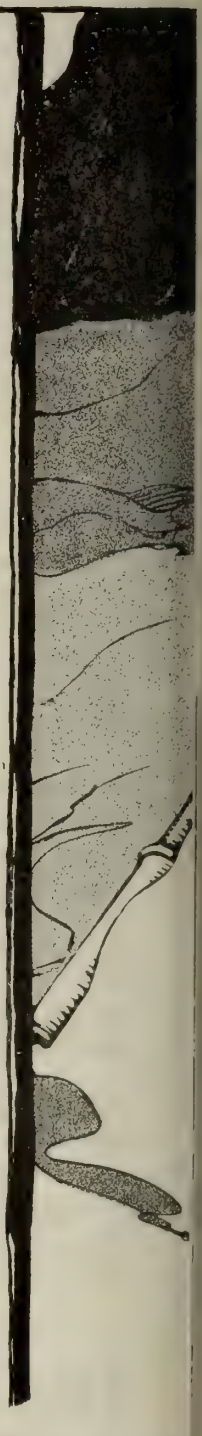
# You Can't Row a Boat with One Oar

An unbalanced advertising campaign, like a one-oar boat, never gets anywhere.

Sound copy must be balanced by scientific space selection. Mediums deserve as much attention as merchandising.

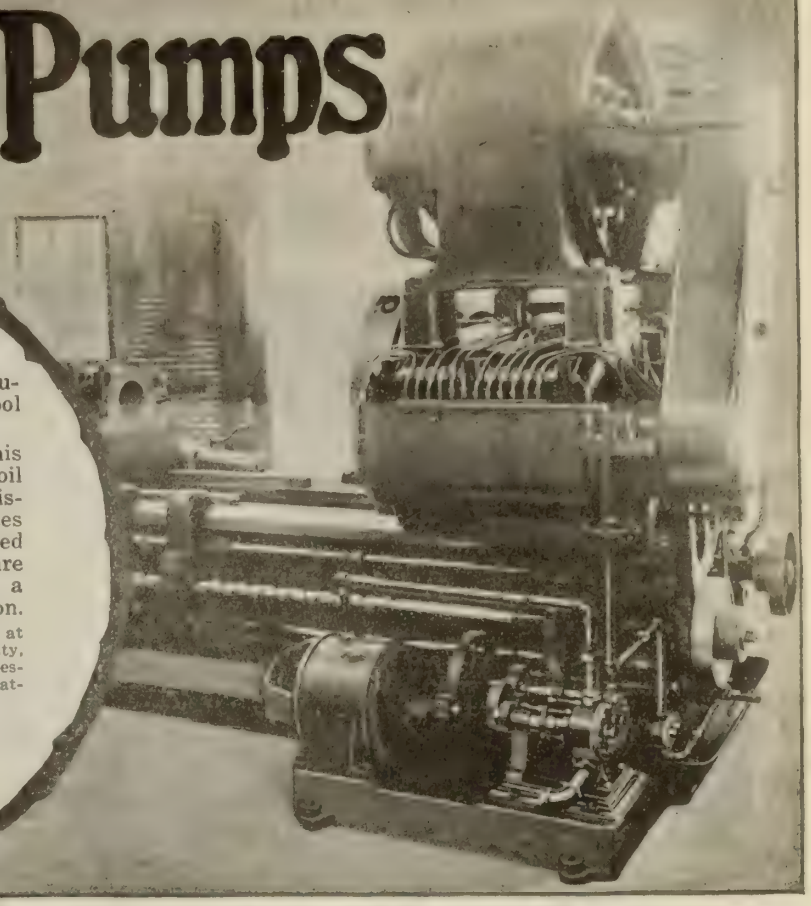


To buy space scientifically circulation must be *analyzed*—not merely counted.

Do you ask of a publication not only "How much?" but also "How did you get it?" and "Where does it go?" If you fail in these particulars you are trying to make an advertising campaign go with only one oar.

The answers to these questions can be obtained by studying the A. B. C. reports. To read the circulation figures only is not enough, even though they are verified by the A. B. C. audit. This is but the beginning.

Advertising is being put to a test to-day, which it can meet if you put circulation to the test of A. B. C. reports.



Canadian Machinery is a member of The Audit Bureau of Circulations.

*EIGHT BRANCH OFFICES*

# Trahern Pumps

**On Springfield Tools**

Here is one of the huge machines, manufactured by the Springfield Machine Tool Co. of Springfield, Ohio.

Two TRAHERN Pumps are used on this machine. The smallest pump draws oil from reservoir under headstock and distributes to bearings. Oil then passes through special strainer and is pumped by the larger pump under 80 lbs. pressure to the tools. There could hardly be a more efficient or economical installation.

TRAHERN Pumps are Rotary Geared, operate at low speed giving long life, have large capacity, forceful, non-pulsating streams against high pressure. They will supply coolant to one or a battery of machines.

*Let us send a sample pump for trial in your plant*

New Glasgow, N.S.

Sales Offices:
Western Room 14 Windsor Hotel
MONTREAL

*Name of Hardware Merchant and further details supplied upon request*

# The Answer is—He Didn't!

THE crowd was drawn by a hardware firm in an Ontario town of 700 population. This crowd of over 1,000 people represents customers of the store, drawn from miles around, to attend the picnic given by this firm to its customers. Surely this is evidence of the close relationship between this hardware firm and its customers.

The close relationship between retailer and customer in this instance is typical of conditions existing in hundreds of Canadian towns, villages and cities.

The average hardware merchant (particularly in the smaller cities and towns) has been established for many years. He has a big business connection built up through years of efficient service to his customers. He is well rated, and a desirable man with whom to do business. He influences the buying habits of the people in his community, and in over 90% of the sales made, he is the deciding factor.

*"Which one do you recommend?"* is a question asked thousands of times each day in the hardware stores of Canada.

If you can get the effort and enthusiasm of the retail hardware merchants and their clerks, plus their window and interior displays and local advertising behind your goods, you will have secured the co-operation of one of the greatest available selling forces.

HARDWARE AND METAL is paid for, and read, by all the wholesale hardware buyers of Canada, and over 90% of the retailers from coast to coast. They are the men who control the sale of your products to the hardware consumers. HARDWARE AND METAL can put your story before, practically, the entire Canadian hardware trade. One of our representatives would be glad to give further details.

(Only hardware paper in Canada with membership in the Audit Bureau of Circulations).

## HARDWARE & METAL

*Canada's National Hardware Weekly since 1888*

**143-153 University Avenue - - Toronto, Canada**

*Published every Saturday since 1888. The only weekly hardware paper in Canada, and the only hardware paper in Canada that gives you a circulation statement audited by the Audit Bureau of Circulations*

# D. K. McLaren's Leather Belting

## *Look for the Oak Leaf*

BACK LEATHERS—This is the best portion of the hide for belting purposes. Every inch of D. K. McLaren Belts represents Flawless Backs of the hides of the choicest steers.

BRITISH-OAK-TANNED — The most approved process known for preparing belts for hard service. Every bit of the hide's natural strength is preserved in D. K. McLaren's belts by the expert use of this famous process.

Back of the D. K. McLaren Oak Leaf is a tangible prestige.

The years we have expended in building a reputation for D. K. McLaren's Belting, have not been wasted.

By building every belt to the best of our ability and thoroughly testing every inch of it before stamping it with the Oak Leaf, more and more firms are coming to realize that the D. K. McLaren trade mark is a guarantee of unfailing quality.

We shall be glad to send you a list of prominent customers of ours which will convince **you.** Shall we?

### *Large Capacity--Quick Service*

The Machinery Manufacturer, the Agricultural Implement Maker, the Automobile Builder, and Specialty Manufacturer—can secure his Malleable and Grey Iron Castings quickly when he orders International Malleable Products. We have the facilities for making exceptionally good deliveries on the largest of orders.

Specify "International Malleable" on your next order for Malleable and Grey Iron Castings, and Malleable and Grey Iron Pipe Fittings.

In addition to quick service you secure reasonable price and quality products.

## INTERNATIONAL MALLEABLE IRON COMPANY
LIMITED
GUELPH, ONTARIO, CANADA

# Odd, Isn't It

that some people think of advertising as a means of benefiting only the seller, when its basic function *must be* to render a necessary service to the buyer, else it could not exist. Merchandise lives or dies as it does or does not meet a human need. Advertising is subject to the same law of service. The real measure of its value is what it *gives*, not what it gets.

In the light of these truths, the marvellous growth of advertising in itself, is an impressive demonstration of its essential character in our economic system.

But you are not interested in *all* advertising any more than you are in all merchandise. That is one big reason why you have a highly specialized Business Paper in your field such as the one carrying this advertisement. It was born of your needs, not of any man's desire to be a publisher.

## *How It Works for You*

What it does for you and your field editorially is self-evident, but its *ad*itorial service is just as vital. Instead of a buyer having to depend upon gossip, hearsay and driblets of information from this or that source, he gets it all between two covers.

Timely, authoritative, comprehensive statements about needed materials pass in review as the advertising pages are turned. Confident judgments can be formed, and intelligent decisions made.

Yet advertising is NOT an *added* expense, but an improved distributive process, which takes the place of slower, more costly and less efficient methods.

That is why it pays to *read* advertising even more than it pays to advertise. Especially if you read it in papers which have met the exacting requirements of membership in The Associated Business Papers, Inc., for one of its standards of practice requires that a paper must *decline any advertisement which has a tendency to mislead or which does not conform to business integrity.*

**You are invited to consult us freely about Business Papers or Business Paper advertising**

**LIST OF MEMBERS**

*Each has subscribed to and is maintaining the highest standards of practice in its editorial and advertising service.*

## DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

### MACHINE TOOLS AND METAL WORKING EQUIPMENT

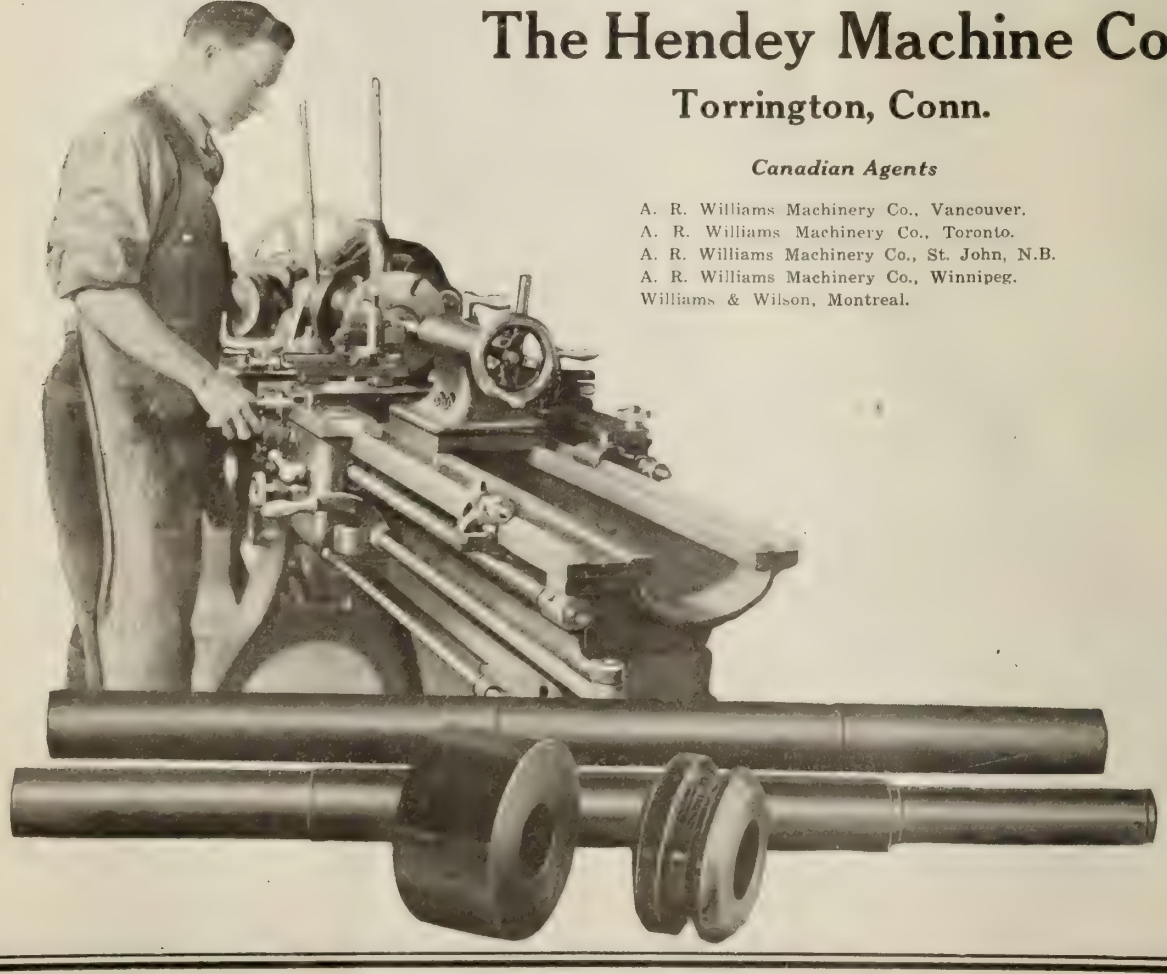
# HENDEY

## *A Poor Tool Is Dear At Any Price*



To manufacture high-grade products you must have high-grade tools—any others are dear, no matter how little you actually pay for them.

When a tool is in popular use among the most exacting concerns, that tool must be thoroughly dependable in all its work.

Though there are many advantageous features to Hendey machines, each is second to reliability.

Not only does the high-powered Hendey keep manufacturing costs down to the minimum on reputation work—when occasion demands it, the Hendey, too, is used with unqualified success for a great variety of work—precision work of the closest kind is necessary.

**Consider the reputation of Hendeys among their present owners when in need of lathes, shapers, millers or centering machines.**

## The Hendey Machine Co.

# His Work Guide is a PHOTOSTAT Print

(REG. U.S. PAT. OFF.)

## *Speed Up Your Production Too*

The whole world sorely needs every helpful effort.

This machinist is working from a Photostat print made direct from a pencil sketch.

Hours and often days are thus saved in putting work into and through the shop.

In the office, too, the Photostat is invaluable because it makes facsimile copies of blue prints, maps, charts, progress sheets, sales sheets, advertising layouts, etc.

Send for our booklet in which some of our customers tell in their own way how the Photostat is used both for standard and special work.

The Photostat is made by the Eastman Kodak Co., exclusively for the

# New Files for Old!

LET this be the rule in your shop. Tell your workmen to discard files when they cease to cut keenly.

Only then will you get the full value from your workmen's time and effort. Dull files mean poor work and wasted effort.

The following brands have been the standard for over fifty years and give maximum service before getting dull:

KEARNEY & FOOT - AMERICAN
GREAT WESTERN - ARCADE - GLOBE

## FILES AND RASPS

Made in Canada by:

## Nicholson File Company

PORT HOPE - ONTARIO

## You can't help noticing the good qualities of Pratt & Whitney Taps

Their free cutting qualities, their extreme accuracy and their extraordinary ability to outlive others distinguish them.

The con-eccentric relief—a distinctive P & W feature—is the secret of their goodness. One-third of the cutting edge is concentric. The remaining two-thirds has eccentric relief. Taps can be sharpened at the only correct point—on the face of the cutting edge. Sharpening in no way affects their size.

Yes, they cost a little more than some others, but they're well worth the difference. Carried in stock as are all other P & W Small Tools at our sales offices and agencies as listed.

# New Business Possibilities

A real regrinding machine. See how easily it handles a six cylinder en bloc.

## Regrinding Cylinders

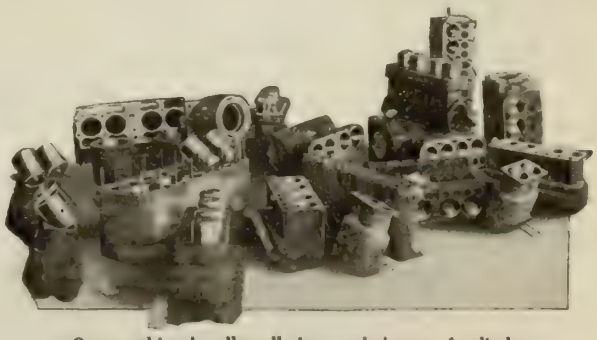
***Makes Used Motors Better Than New***

Some one in your vicinity is going to buy a regrinding machine and get the cream of a profitable business. Are you the one?

### Opportune Time

There is no business to-day that has the possibilities and which fits as nicely into a small machine shop, automobile repair shop, or a concern doing welding, as the regrinding of worn or scored cylinders.

### Advantages to the Automobile Owner



Reground cylinders fitted with new pistons and rings will give the motor much, if not more, power and pep than when it was new. It cuts the oil and gas consumption in two and stops all excessive smoking.

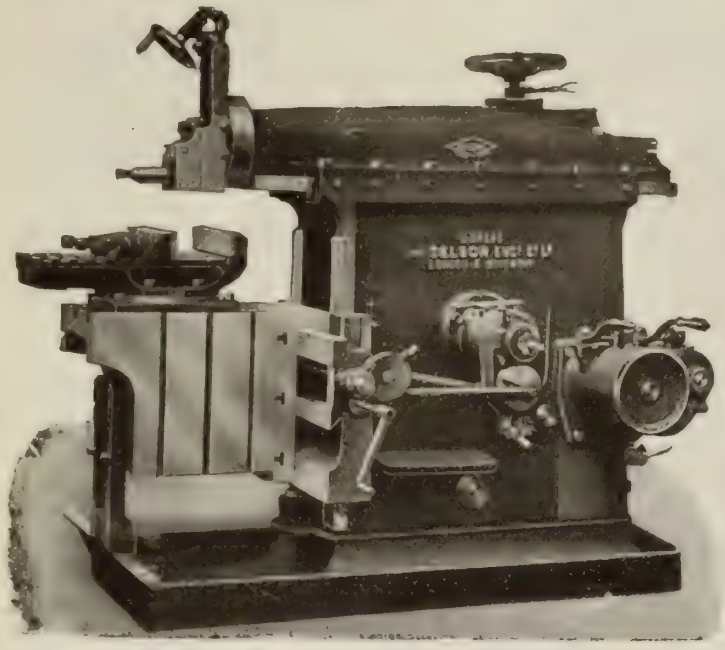
Whether you are already interested in automobile repairing or are seeking some profitable business to go into, be sure to consider the regrinding of motor cylinders.

### Necessary Equipment

Eighty per cent. of all pleasure cars and ninety per cent. of all commercial motors manufactured are ground. Heald Style No. 55 is built expressly for re-grinding work. It is simple, moderately priced, self-contained, and has a very large capacity and range, easily taking care of singles, doubles, four and six en bloc cylinders.

In addition, to handle the work satisfactorily, one should have a small lathe and drill press. bench and hand tools. A small external grinder would be convenient for finishing pistons, thus enabling the shop to purchase semi-finished pistons and grind them to oversize required.

One machine handles all sizes and shapes of cylinders



Now is the time to get started. We would like to talk with you personally or mail you further information.

# THE JOHNSON FRICTION CLUTCH

## The Case Against the Countershaft

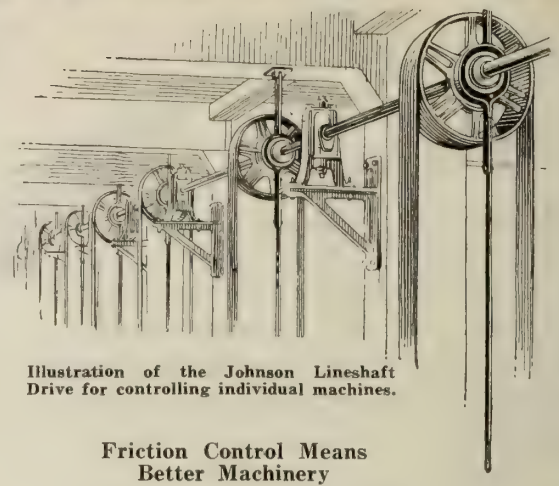
The old familiar countershaft drive, through cross belts and tight and loose pulleys, stands accused of the following offences against efficiency:

1. Involves needless equipment.
2. Costs too much to set up.
3. Prevents economical and systematic use of space.
4. Operates sluggishly.
5. Multiplies belt troubles and the resultant cost of upkeep.

**Modern practice has discarded the antiquated countershaft for the simplicity and efficiency of the clutch drive direct from lineshaft..**

**Adopt the Johnson Lineshaft Drive**

The economical, efficient and durable method of power transmission through friction control.



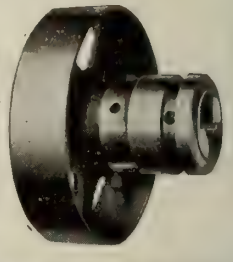


Illustration of the Johnson Lineshaft Drive for controlling individual machines.

**Friction Control Means Better Machinery**

Whether it is applied overhead or in the machine itself.

**Write for our Booklet "Clutches as Applied to Machine Building" and our Yellow Catalog.**

# HOFFMANN Roller Bearings

## *British Made---to British Standards*

Hoffmann Roller Journal Bearings are used in locations where loads are too heavy for ball bearings of a size which the design will permit. They carry loads at least 50% greater than will ball bearings of equal size, and run without difficulty at speeds quite as high.

Hoffmann Roller Journal Bearings can be supplied to carry almost unlimited loads, with minimum friction and wear. Bearings in actual service show really remarkable results in freedom from wear or trouble of any kind. This is the result of the extreme accuracy and perfection of finish which are features of all Hoffmann Bearings, both roller and ball.

## HOFFMANN Steel Balls

are made in one grade only—the best—and every ball is guaranteed within .0001 in. of standard, both in spherity and size.

*We are prepared to supply from stock standard sizes of Hoffmann Bearings and Balls in both inch and metric dimensions. If you are designing new equipment, or having any bearing troubles, our engineers will be glad to advise you.*

*Sole Canadian Distributors:*

# ROYLITE
## CLEANER

### *A New Discovery!*

ROYLITE Cleaner represents the very latest and most successful development in the process of chemically removing oil, grease, enamel, paint or any kind of dirt from metal in the quickest and most thorough manner.

Formerly most cleaning solutions consisted of caustic soda, potash or lye which saponified grease and acted like a soap. The alkali strength was quickly used up because the action caused a precipitate and heavy sediment formed at bottom of solution.

The new Roylite process emulsifies mineral oil and heavy greases which cannot be saponified, by lifting them from the work to top of solution, thereby avoiding the precipitate action, making it unnecessary to throw out solution but merely add small quantities to sustain its strength.

Guaranteed not to discolor or tarnish the brightest surface.

Our men will gladly give you demonstrations. Order a barrel to-day on approval.

*Lasts longer — Works quicker — Costs less*

# ? Who was the Third Man?

WHEN the retirement of Sir Robert Borden as Premier of Canada was first announced, three outstanding men were considered as his possible successors. Their names were displayed prominently in every Canadian newspaper. The present Premier was of course one of the men mentioned. Sir Geo. Foster another. Who was the third man? You would remember him no doubt if his name were displayed prominently in the daily press to-day—but he has retired from the political arena, and his name is seldom mentioned.

How easily names slip from the memory when they cease to be given publicity.

There is a lesson here. If you wish your name and the name of your products to be remembered, you must give them constant publicity.

The prudent manufacturer of machine tools, power plant equipment, or industrial supplies of any kind places his name and the name of his products where they will be seen and remembered to best advantage: **in reliable technical newspapers.**

Reliable technical newspapers in Canada are those included as members of Canadian National Newspapers and Periodicals Association. Their circulation is bona-fide and their editorial practice is carefully guarded, in fact their whole policy must conform to the highest standards else they would not be eligible to membership in the association.

*Canadian Machinery*

*Power House*

*Canadian Foundryman*

*Marine Engineering*

*Each of these technical newspapers is a member of the Canadian National Newspapers and Periodicals Association.*

YALE

# Getting the most from the pay-roll

Yale Chain Blocks cut production costs because they eliminate waste labor—the unproductive lifting, shifting and hauling of weighty materials. The full extent of their usefulness has never been calculated because new uses are being discovered every day.

The name Yale stands for mechanical perfection and Yale Chain Blocks are undoubtedly the last word in sturdy construction, safety and quickness of operation. Every Yale Chain Block has a Yale Safety Hook that gives visible warning if seriously overloaded. This is but one of the many unusual features of Yale Blocks.

## Norton Grinding Wheels Meet Every Requirement.

Norton Grinding Wheels are modern cutting materials that meet every grinding requirement. Every possible precaution is taken during the process of manufacture to produce only such wheels as are free from defects. All wheels are inspected between operations and any which are found to be defective are rejected and broken up. Norton Grinding Wheels have proven a most economical and reliable abrasive, and as such are in wide use in machine shops everywhere.

Our nearest Sales Office will gladly send detailed information of special interest to purchasing agents.

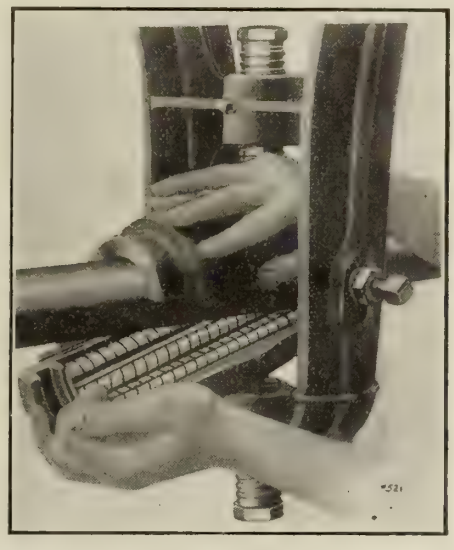
# Roller Bearing Equipment for Line Shafting

## Power Loss, Through Friction in Line Shafting, is a Dividend-Reducing Leakage—It Can Be Avoided—Development of Roller Bearings Has Increased Their Popularity— Points on Maintenance

By J. F. McGUINNESS*

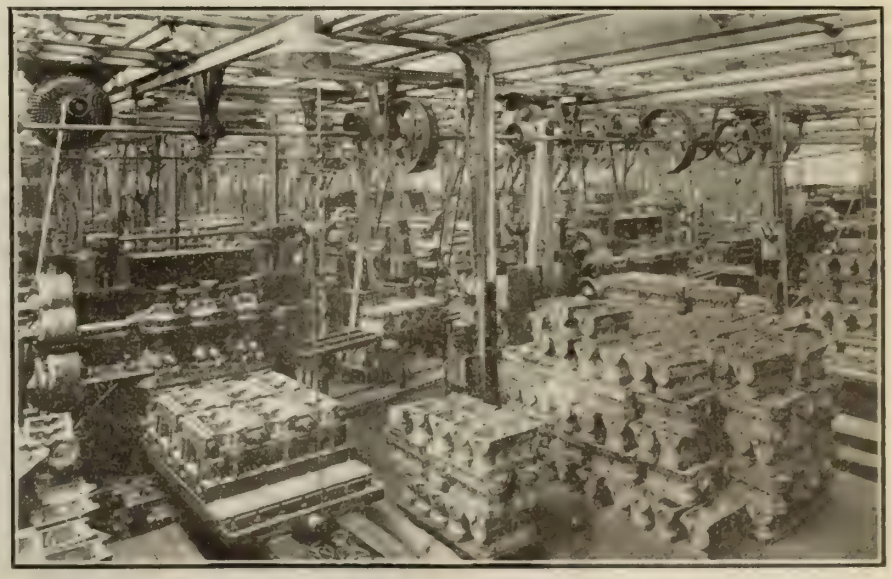


THE question of suitable bearings for line shafts is now receiving a greater amount of careful consideration than ever before, and manufacturers generally have proven for themselves that the loss of power through friction in line shafting is a dividend-reducing leakage that can be eliminated. Let us tackle the proposition from the viewpoint of the manufacturer, the man who pays the bills and is directly interested in keeping down to a minimum the cost of plant operation.

### Power Absorption

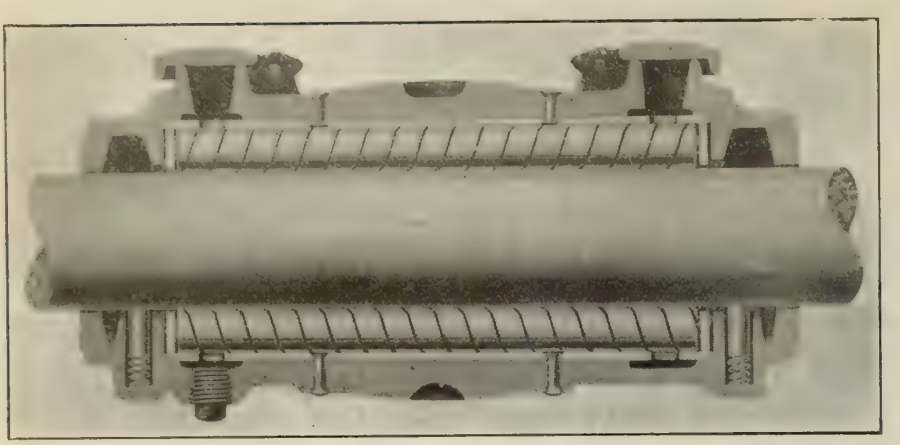
The line shafts that carry power to the machinery throughout a plant really constitute the arteries of the plant, and as such should be given sufficient freedom in operation to insure proper and efficient distribution of the energy carried to the productive equipment. Every hampering factor, exerting pressure on the shafting, will tend to destroy its efficiency and create a loss of power, which cost many dollars to develop.

It is generally conceded that the friction created by contact between line shafting and plain babbitted bearings supporting it amounts to more than half of the total friction loss between the prime mover and the producing machines, and in most plants this friction load averages about 30 per cent. of the total power used and is reflected in high coal bills or electric power bills. Statistics show that more fuel is consumed per a year in turning the line shafting of the country's manufacturing plants than in the operation of all the railroads.



To such an extent has the magnitude of this loss become evident to mechanical engineers and factory owners that a sufficient demand for better shaft hangers has resulted in the appearance of a number of very good ball and roller bearings, all differing somewhat in design and construction, but functioning in one direction—providing rolling action instead of rubbing friction.

SHOWING HOW SIMPLE IT IS TO APPLY ROLLER BEARINGS TO THE SHAFT WITHOUT DISTURBING THE PULLEYS, COLLARS, OR COUPLING, OR TAKING DOWN THE LINE SHAFT.



In the pioneer days of anti-friction bearings, the cost of ball and roller bearings for use as power transmission equipment was very high in comparison with that of plain boxes. The cost of power on the other hand was comparatively low ten years ago, so that with these cost factors to consider, the use of anti-friction bearings did not appear as a very attractive proposition to the manufacturer and the idea was naturally slow in taking root.

Development and perfection of the manufacture of anti-friction bearings, and the increased demand for equipment of this character has enabled manufacturers to market ball and roller bearing hangers at prices within the reach of all. Combined with this is the increase in the cost of developing power, power costs on the average being higher than formerly. This figure of cost per horsepower year varies according to locality.

A SMALL PORTION OF THE FORD MOTOR PLANT. NOTE THE METHOD OF SUPPORTING LINE SHAFTING. ROLLER BEARINGS ARE USED EXCLUSIVELY IN THIS PLANT.

*Directing Transmission Engineer, Hyatt Roller Bearing Co.

RELATIVE POSITIONS OF SHAFT, ROLLERS, OUTER RACE AND OILING
RELATIVE POSITIONS OF SHAFT, ROLLERS, OUTER RACE AND OILING
ARRANGEMENT.

With a reduction of 15 per cent. in the cost of power, or, to present it in another way, reducing the cost of each horsepower year, there is sufficient saving to produce a substantial return on whatever investment is made in anti-friction bearings. As the prices vary, however, it cannot be stated here with any degree of accuracy just how long a period is covered before the bearings will pay for themselves on the basis of power saving only. In any case, two years is the maximum time required, although a number of tests have been made showing a return of the investment in half of that time.

### Maintenance

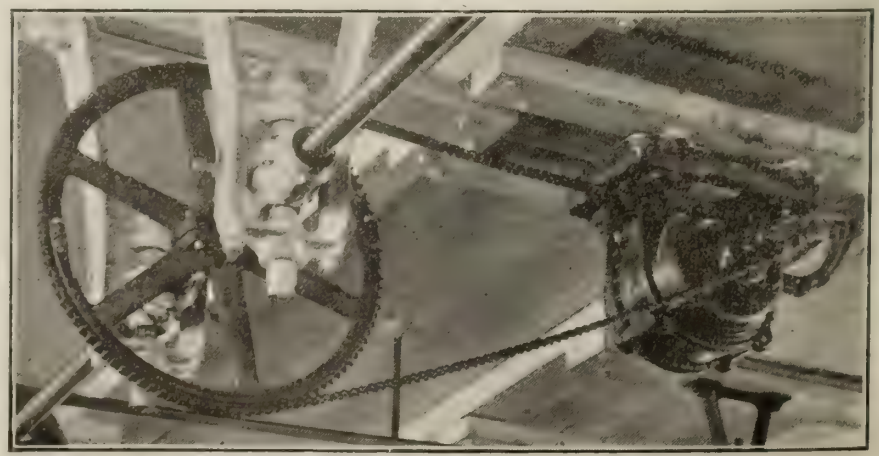
In addition to the enormous loss created by friction when line shafting is operated in plain bearings, the cost of oil and oiling labor is worthy of careful consideration. In this respect, plain or babbitted boxes to my mind can be classified as luxuries because of the constant lubricating attention they require. Some of the plain boxes now in use require a charge of oil daily. Others must be looked after at least once a week and there are a number of boxes with devices for storing lubricant so that an oiling once a month is necessary. The average plain bearing, however, requires oiling every week or 52 oilings per year. The slightest omission in lubrication of babbitted boxes, or forgetfulness on the part of the oiler, immediately endangers the plant to the possibilities of interrupted production through hot bearing trouble. Only a small portion of the lubricant used in oiling plain bearings serves its real purpose. The greater percentage is destroyed by heat caused through the development of friction or leaks out uselessly.

With the reduction of friction in ball or roller bearings, a destructive feature is eliminated. With nothing to create waste, no more than four oilings per year are necessary for any type of anti-friction hanger and the amount of oil required for each oiling is no greater than that used once a week with each plain box. Eighty per cent. is a very conservative estimate of the saving in oil and oiling labor where anti-friction bearings are used, and, as it is with power saving, there are hundreds of pieces of evidence testifying to the low maintenance cost of anti-friction hangers.

### General Advantages

The successful manufacturer is the one who strives for highest efficiency on the part of every one connected with his organization. He insists that every employee produce to the maximum or seek employment elsewhere. It is only logical therefore that this idea be carried out and applied to wastful plant equipment, especially to such equipment that can be easily replaced by units already assembled and requiring very little effort in their installation.

While the direct benefit derived from the use of anti-friction bearings is reflected in power and maintenance charges, it must also be remembered that where line shafting is running in plain bearings, there exists a wear and tear on motors, engines, belting and even on driven machinery, which adds considerably to upkeep costs. With the elimination of the destructive factor responsible for this, the life of belting is materially increased, motors and engines require overhauling less frequently and power is delivered to the producing machinery with greater uniformity, and in greater volume.



In a word, the reduction of the cost of plant operation is so pronounced where anti-friction bearings are in use that the user of power who realizes that he must utilize all of it for the purpose for which it is developed, with the least possible loss, will find it to his advantage to look into the conditions existing in his plant with a view towards placing his transmission equipment on the most efficient basis possible.

## THE RECLAMATION OF SCRAP

One good thing that came out of the war was the awakening to the value of so-called scrap material. At a recent meeting of the American Railway Engineering Association, it was shown that at the present time many railroads have special reclamation shops.

A reclamation plant established by the Rock Island lines at Silvas, Ill., has a scrap dock 48 ft. wide and 1,500 ft. long, with six bins 28 x 42 ft. for storing unsorted scrap, eight bins, 28 x 30 ft., for sorted scrap, and 74 bins of various sizes for sorted scrap. Three traveling gantry cranes of 4 and 10 tons capacity have lifting magnets for 1,500 and 8,500 lb. loads. A shop 25 x 270 ft. contains a 100 pound hammer, two 150 pound hammers, double and single alligator shears, bolt shear, rattler for cleaning, drill press, nut tapping machine, four electric welders, four oxygen welding outfits, air-operated shear, and air-operated punch.

This plant is doing such work as welding cast-iron spokes on driving wheels, building up worn spots on firebox castings with acetylene welding; mating and repairing flange-worn steel-tired wheels before turning, thereby saving a great deal of labor; reclaiming salt deposits from refrigerator cars for use in thawing switches during the winter, and for use in fire barrels; pressing oil from waste (one barrel of waste netting about 20 gal. of oil); burning the waste and reclaiming about 50 lbs. of babbit, reclaiming barbed wire for use in building rip-rap.

THIS STYLE ROLLER BEARING CAN BE APPLIED WTH THE LINE SHAFT, COLLARS AND COUPLINGS IN PLACE.

# Various Forms of Die Beds and Punch Holders

## Sub-Press and Drop Hammer Type—Beds With Forming Slides—For Round Dies With Extension Backs—Diagonal Post Dies—Spring Pad Arrangement—Pillar or Post Die Beds

By F. SCRIBER

ONE of the most common machines in use, and one, therefore, which is apt to be overlooked, is the punch press. To some this machine merely consists of a surface to set a die on and a ram operating up and down which carries punches. The function of this article is to describe die beds, some of which are in common use, others which are of rather a special nature. It has been the writer's experience that the men who have the upkeep of punch presses are rather prone to adopt one form of die bed or "die holder" as a preference, regardless of conditions, thus sacrificing more advantageous setups which can be obtained by taking a broader view of the subject. Before going further, it is perhaps well to define just what is meant by die bed. This, in the sense used by the writer, is that portion of the die which is usually made of cast iron, and into, or upon which the cutting die, which has to be replaced from time to time, is mounted. It is customary to mount this die bed on a bolster plate contained on the body of the press.

Referring to Fig 1, to the left of this view is shown a die holder having a dovetail slot cut across it with screws to hold the die in place. This holder is for simple blanking dies used in making up job lots where small production is required. The die proper, A, is set into the cast iron block B, and is held in place by screws C. Above the die holder is shown a punch holder of similar construction. This punch holder has a round shank D, which fits a hole in the ram of the press, and is operated as a unit thereto. At the right of Fig. 1 is a die holder having a steel gib E, between the die and the holder, against which the screws F, come. In the punch holder shown above is a tapered gib G. This is for wedging the die in place, a tap on end H, with a hammer securely holding the die or punch in place, while a tap on the opposite end permits the removal of same, it being customary to employ either of the two constructions shown on the same class of work.

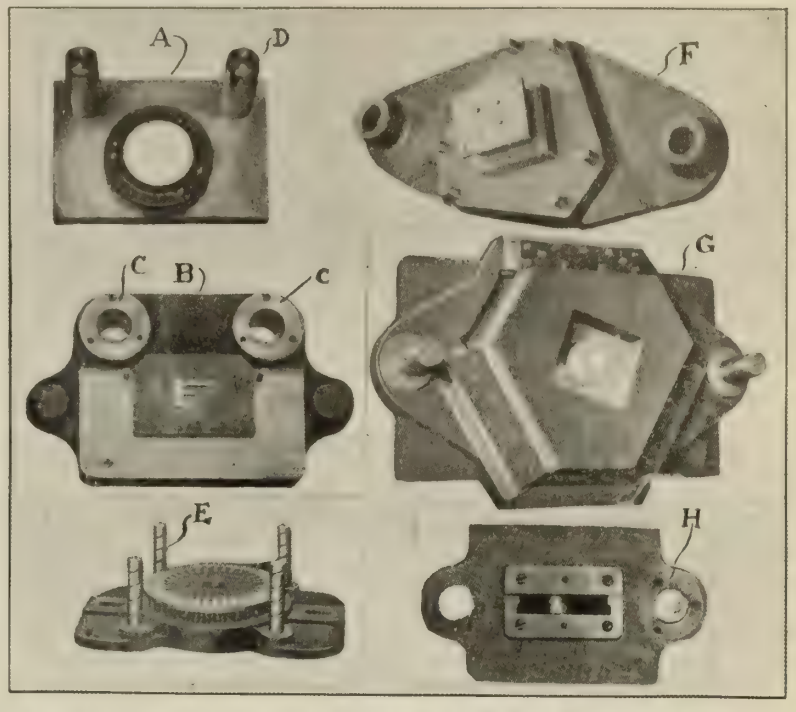


FIG. 4—A GROUP OF PILLAR OR POST PUNCH AND DIE HOLDERS.

Fig. 2 illustrates four types of die beds. A is a cast iron bed having a square seat, B, in which the dies are fitted and doweled against movement. C shows the same type of die bed fitted with a plain hole D, and elongated hole E. This construction permits of loosening the bolts without removing the die holder from the press, pivoting the same on bolt D, thus bringing the die from under the ram of the press, so it can be removed from the holder for grinding purposes.

In the upper right hand corner is

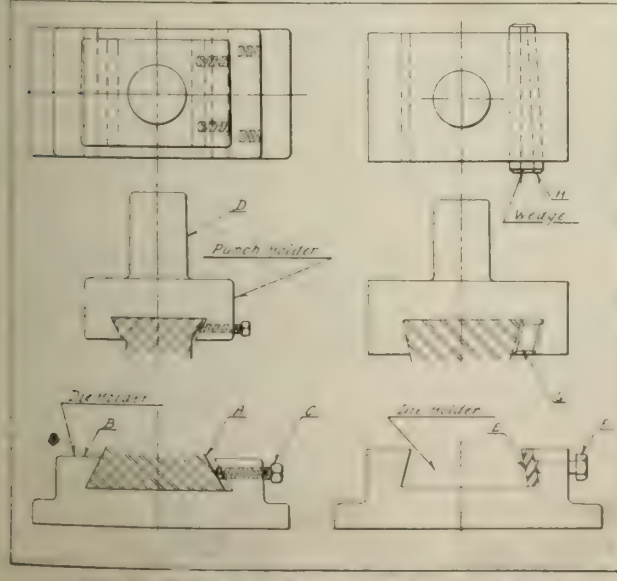

FIG. 1—TWO TYPES OF PUNCH AND DIE HOLDERS.

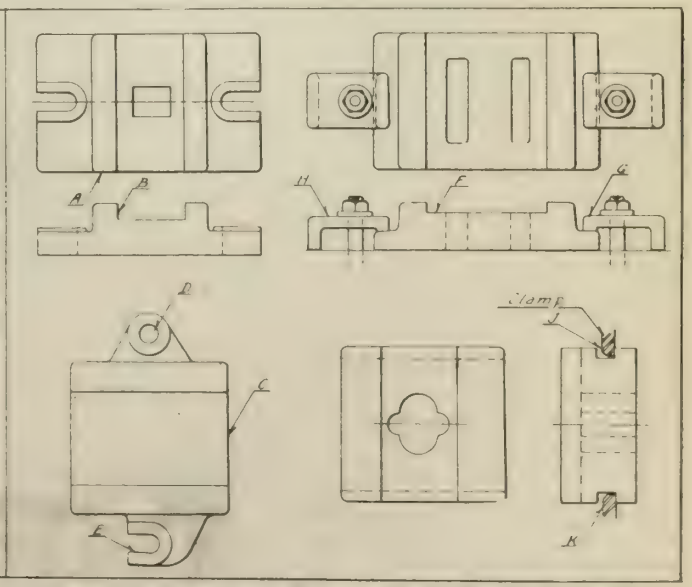

FIG. 2—VARIOUS DIE BED HOLDING DOWN METHODS.

shown a die bed F. This depicts two clamps, G and H, which are used for holding the bed in place. This construction permits the use of a number of different die holders on the same bolster without drilling various holding down bolt holes. It also obviates the necessity of putting holes or slots in the die beds. In the lower right hand corner is shown a die bed which has slots, J and K, cut into it. Clamps may be inserted into these for holding the die bed to the bolster on the press.

### Keep in Line

In the construction of die beds as often made, it is necessary for the operator in setting up the press to be very careful and have the punches in line with the dies. In the construction shown at Fig. 3 two steel posts, or guide pins, are provided to keep the two members (die holder and punch holder) in line. The punch, or punches, are mounted on surface B of the holder, while at C are mounted the die units. The posts are provided with oil grooves and the punch holder slides up and down on these posts. The application of this post construction is particularly desirable for blanking and piercing operations, although not so necessary for forming where the natural contour of the form keeps the punch and die in alignment. Posts of this design are shown at opposite corners, and the group of die and punch holders shown in Fig. 4 are of interest in this connection, as they illustrate varied applications of these die holders. At A is a punch holder containing two posts at the rear, below this at B is the die holder used with the punch. In this die holder are certain bushings, C, and posts, D, slide in these bushings. At E in the lower left hand corner is a die holder containing four posts, while in the upper right hand corner is a holder having two post holes directly opposite on the centre line. This holder is indicated at F. At G is the die used for this work. In the lower

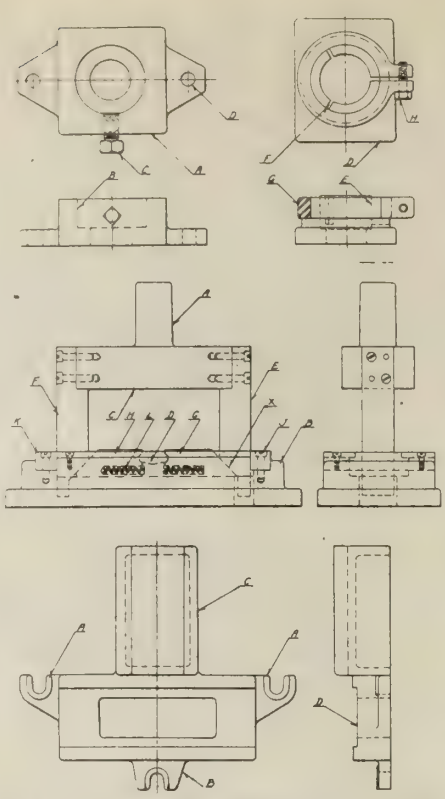

FIG. 5—TOP VIEW SHOWING TWO DIE BEDS FOR ROUND DIES.
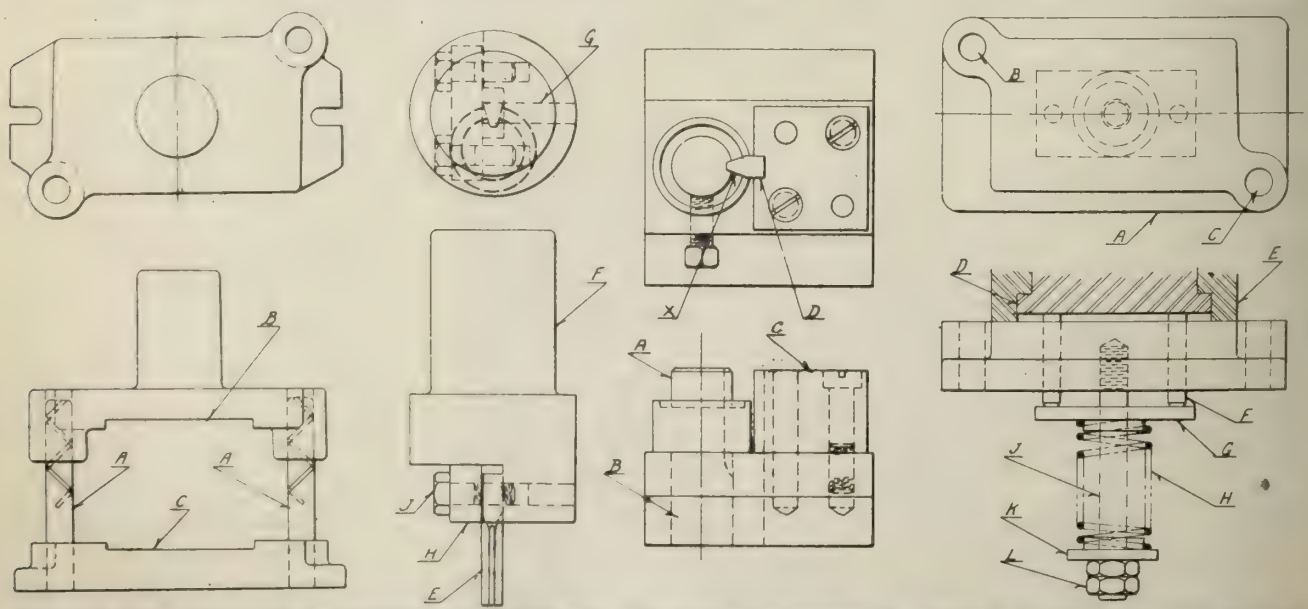
FIG. 9—CENTER, SHOWING DIE BED WITH SLIDES FOR SIDE FORMING.
FIG. 10—BOTTOM VIEW. DIE BED WITH EXTENSION BACK.

right hand corner at H is a small die holder, in which the guide pin holes are bushed and are directly opposite on the centre line. It is preferable where two guide posts are used to have them either as shown at F, G and H at the centre, or as shown in Fig. 3 diagonally opposite.



If diagonally opposite, the stock from which the blanks are made can be fed through on the centre line the long way of the die holder and be clear of the posts, a condition which is obviously impossible where the die is constructed as shown in F, G or H in Fig. 4. This condition is merely pointed out as one to be guarded against in die design, as, of course, it was not necessary to feed the stock in the aforementioned manner when using these dies. When using die and punch holders with two posts at the rear, there is a tendency to have the slide member cramp on the post, where there is lost movement in the slide of the press, while where four posts are used it involves more work in making the die bed, while the die surface is not as accessible.

Two constructions especially adapted for holding round dies are illustrated in Fig. 5. The first of these at the left shows a simple holder A, counterbored at B, to receive a die which is held therein by a set screw C. This holder has two holes, D, for holding it to the bolster plate of the press. It is frequently the practice to omit the screw C and hold the round dies in place with filister head screws from the top. At the right of Fig. 5 is a holder made of steel and indicated at D. This is also counterbored to receive the die at E and has three saw slots, F, cut into it. Over the outside of holder a split collar, H, is mounted, and with the die in the hole, E, tightening of split collar with bolt H, securely holds the die in place.

### Other Examples

With one or two exceptions the foregoing illustrations have been devoted to detailed description of die holders. In the remaining views are shown arrangements which involve a description of some of the operative units of die construction. No attempt will be made to show definite applications of the tools to the work, that being outside of the scope of the present article.

Referring to Fig. 6. This shows at the left a sub-press type of die holder while at the right is a drop hammer die holding arrangement. In the case of the drop hammer the die holding mem

READING FROM LEFT: FIG. 3—DIAGONAL POST DIE BED. FIG. 7 ARRANGEMENT OF SIMPLE PUNCH AND DIE HOLDER.
FIG. 8—DIE BED CONTAINING SPRING PAD ARRANGEMENT.

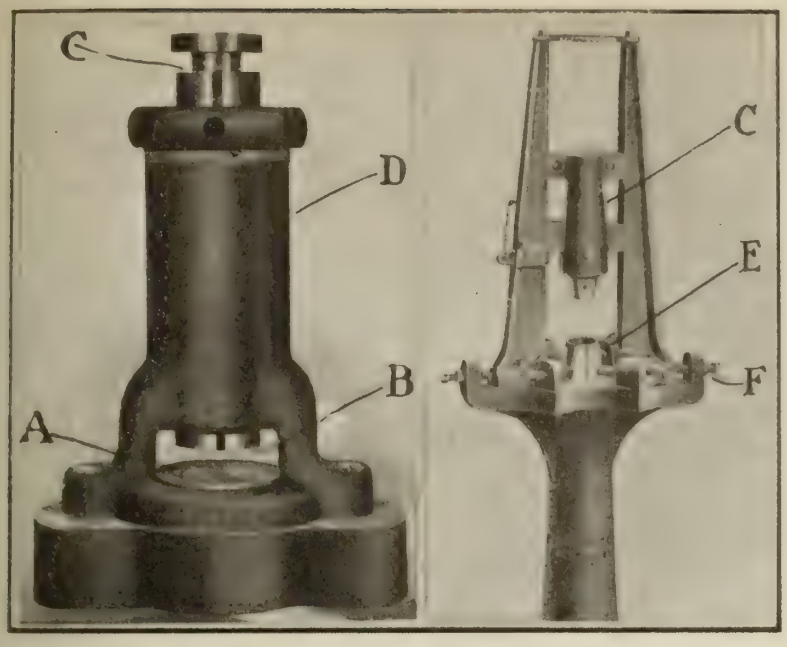


FIG. 6—TWO FORMS OF DIE SET-UPS. LEFT, THE SUB-PRESS TYPE. RIGHT, THE DROP HAMMER BED.

ber is built permanently into the machine. Referring to the sub-press type, the die is located at A, while suitable punches are placed in the plunger B. This plunger is attached to the ram of the press at C, and slides up and down in the bracket D. This holds the die and punch in alignment and adjustable bearings are provided to hold plunger snugly in the body of the sub-press. This type of die holder is used mostly for small accurate work.

Again referring to the drop hammer type. Die E is held in place by screws F, which are contained in lugs on the body of machine. The ram G contains the punch, and it is customary in using this tool to raise the ram, letting it drop by its own weight to perform the work. An arrangement of a die and punch holder where the units are all made of steel is illustrated in Fig. 7. The construction of this is rather simple and embodies principles of good design. The die A consists of a round stud hardened and drawn to the proper temper. This is mounted in a steel block B. At C is another steel block, which is cut away at D, so that it will back up the punch, which cuts a tapered slot as indicated at X, when the punch descends. It is a simple matter to renew the die A while retaining the other parts, B and C, thus reducing the repair costs to a minimum. The punch E for this die is mounted in a steel holder F, which fits into the ram of the press. This punch slips over a dowel pin G, held on the holder F, the holder being grooved out to receive the same. A steel clamp H, held in place by two screws J, securely holds the punch in place, all of which makes a very substantial arrangement for performing the operation shown. In the design of numerous types of dies it is often necessary to incorporate a spring pad. This is particularly true where blanking and forming operations are performed in the same die.

Figure 8 illustrates one method of arranging the die to accommodate such conditions. The die holder A, made of cast iron, contains two guide posts at B and C. The spring pad is indicated at D and this is retained in place by an outer ring or block E, which limits the upward movement of the spring. Two pins, F, pass through holes in the die bed and come against a plate G. Against the underside of this plate is a spring, H, that is attached to a stud J, being held thereon by a suitable collar K and check nuts L. When the ram containing the punches descend, the spring pad D is forced down, thereby causing the pins F, through the medium of the plate G, to compress the spring, which is held to the underside of the die body by the stud J. When the ram comes up the spring, pressing against the plate G, forces the spring pad D back to its original position, as shown. Rubber is quite often used in place of the spring for this purpose and it is also quite common to put springs directly under the spring pad D in the cast iron die bed A.

Another complication often met with in press work is the necessity of forming from the sides of the dies. This is usually done in conjunction with a form made from the top, and to illustrate one of the principles of construction used for such work let us refer to Fig. 9. In this illustration A is the punch holder, which is attached by a round shank to the ram of the press. B is the die holder. Attached to surface C of the punch holder would be some form of punch that would make the shape desired. This would be made with a spring pad, so that when it bottomed on the surface of die D, it would remain stationary while the punch holder would continue to descend. This would cause the plunger E and F, which have beveled surfaces on their lower ends at X, to force slides G and H towards the centre surface D. These plungers are backed up by steel seats J and K, while two springs, L and M, are used to keep the sliding members apart. Forcing these slides, H and G, in causes the slides to form from the side, thus in this construction we have three functions performed, that of forming from the top, and from the two sides. The slides, H and G, are sometimes made as side forming punches, and on other occasions are made with punches attached to the slides. It will, of course, be understood that various modifications of this design, embodying one plunger, four or even more are employed in die design to suit the particular job in hand.

Referring to Fig. 10 we see a die body which is held down by three bolts, two of which are at the sides A, and one directly in front at B. This has an extension at the back C, the construction being one that is sometimes used for holding a die on surface D, while the extension C would be used for holding necessary associate parts of the die that have to withstand very little of the cutting strain usually imparted in die works.

In die work the best rules of construction cannot be laid down, as similar methods cannot be employed for making anything from metal buttons to automobile bodies. The type of press and large extent govern the features incorporated in the design.

## POINTS FOR TWIST DRILL USERS

If the drill chips on the edge it indicates that the lip clearance is too great and fails to support the cutting edge. This may be because the drill is too hard. It is advisable to ease off on the feed and watch the grinding.

If it splits in the web, it is either ground with improper centre lip angle or the feed is altogether too heavy. The centre lip should be at about 45 degrees to the cutting lips of the drill. The drill is in best condition when the chip comes in a close coil.

If the outer corners wear it shows that the speed is too high and it should be reduced. This is particularly noticeable in drilling cast iron.

Drilling cast iron can be done at a little faster speed than for steel, but the corners must be watched.—Belts.

## SHOP FLOOR BUCKET

A new type of bucket for use in machine shops or foundries has been introduced by a Cleveland manufacturer. The bucket is retained in a hole especially constructed for it in the floor of the shop and scrap is easily swept into it. Fitting over bucket is a cover of 5-16 inch steel plate which gives a level surface, permitting the operating of trucks over it when closed. An overhead crane raises the bucket from the hole and it is carried to a storage dump where it is emptied, or directly to cars which haul it away to the dumping place.

# Taking the Machinery Out of Promotions

## Reward the Man Who is Really Trying—Take the Mystery Out of Promotion and Rewards—Get a Rating on the Man Independent of His Own Opinion of Himself

By WALTER A. WILLIAMS

THE president of one of America's largest and best known industries, said recently: "Right now, to-day, is the time to take inventory. Not just an inventory of parts and goods and stock, but of the human element. It is a good time to get rid of mental cobwebs, outworn business customs, wasteful habits, and also wasteful, inefficient people. From now on there is going to be man's work for everybody who is willing. Each one of us will have to do more work, and do it better. It is a time to get rid of the slackers and to reward and promote the fighters. For the rest of 1921 is going to be a fine year for fighters."

Now those are good words. They sounded good when heard. They sound good now because they are true. But they have a challenge for every man in business. It is easy enough to get rid of Miss Johnson, who can't manage to get in on time, or to fire Pete Smith, who never did take any interest in his job, but it is just as essential to reward the man who is really trying, to find out who the fighters really are, to take the chance and mystery out of promotions and rewards. Here is the case of Bill Green, for example.

Bill Green doesn't push himself forward. Maybe he lacks what some people call poise, others brass. Yet his type,—the workman who wants to get ahead through better work, who wants to earn his pay and a lot more besides,—is our most valuable national asset to-day. Anyhow, Bill wants an ever-increasing standard of living. He wants to give a full day's work for a full day's pay, and then do a little extra to earn this standard. He doesn't see how he is going to get these facts across to his chief. Nobody in authority knows, for instance, how Bill saved his concern big money when he cut down to seventeen minutes an operation which used to take an hour and a half. When he told his wife, Mary, about designing that new method of joining parts, and they figured out the saving to the firm as almost $16,000 a year, both agreed that Bill deserved promotion. But Bill's foreman, in what happened to be a machine shop, was interested primarily in getting credit for the saving in labor costs as shown by the figures in his own department. He was a good mechanic, was this foreman, but a poor leader of men.

Now, Bill and his kind are numerous, and they are discouraged. They see men getting laid off, but they know they are earning their pay and more. They want to get ahead. They get more discouraged when some man is promoted over their heads because of an accidental discovery by the big chief,—or some other reason which Bill doesn't understand and can't see any reason for. And these mysterious promotions, this lack of some definite method of appraisal of the latent human material in a plant, is one of the most important questions facing every employer to-day. Getting rid of inefficient workmen is important—but promoting the right kind insures future efficiency and is more important still. It makes no difference whether you have an office force of sixteen people in a small town bank, or own a factory employing eighty thousand hands. Some method of taking the mystery out of promotion, some means of getting a rating on a man, independent of his own opinion of himself, and regardless of accidental discovery, is essential if real esprit de corps and morale are to be maintained. And a really sound basis of business prosperity instead of boom times requires better individual efficiency which comes from high morale.

**POINTS BROUGHT OUT**

This is a good time to get rid of mental cobwebs and wasteful habits, for the rest of 1921 is going to be a fine year for fighters.

Reward the men who are really trying. Make no mystery about their promotion. Tell the men you appreciate their efforts, and reward them according to their worth, their true worth, not always what they themselves believe they are worth.

Base your salary on actual ratings, not on guess work. Keep tab on the men's activities. In other words "kill the mystery by means of mathematics."

Let a man have easy access to his rating record. In many cases he can strengthen himself where he is weak, and by hard study and conscientious effort can make real progress.

One concern has done a thing which seems obvious and practical, and it seems to contain a suggestion for every man who employs other men in any capacity. The Boston branch of a nationally known automobile company adopted a plan which does take the mystery out of promotions. And the curious thing is that this concern merely took the best plan in the world for its own use. When I say the best method in the world it isn't quite the exaggeration it sounds because it was the final plan worked out after the best brains in the country had been called in for advice. It is a practical business adaptation of the plan adopted by both the army and navy during the war, to keep in close touch with the latest ability of its officers. Why more concerns haven't stolen the idea, nobody knows. For human nature in industry is the same, and men respond to pretty much the same incentives.

With this concern, it is applied to foremen, sub-foremen, inspectors, and testers, with possible later extension to more subordinate positions. There are now in this concern certain and sure means of discovering relative abilities and shortcomings, and rewarding accordingly; of uncovering dissatisfaction before it starts; of building up a real organization morale so important for making a better product and making the concern a better place to work.

The rating plan used is really a modification of grading proficiency in the various studies, such as those old-time school reports which used to worry us. The qualifications required for each position are carefully analyzed and listed, and the individual is rated on each item with the percentage of his attainment in comparison with the possible. Each qualification is considered in its part relation to the whole. A typical rating scale as used by the army and adopted for industry might read as follows:

**Rating Scale for Foremen**

| | | |
|---|---|---|
| 1.—DEPARTMENT ABILITY. Consider kind and amount of experience; knowledge and resourcefulness in using machines tools, materials, and trade methods. | Highest.. 15<br>High.... 12<br>Middle... 9<br>Low..... 6<br>Lowest.. 3 |
| 2.—ABILITY TO PLAN AND SUPERVISE. Consider ability to maintain standard quality work; to place help where they can do the best work; to plan ahead, so as to have materials, men and tools ready to get out orders on schedule time with minimum production costs, and to keep a steady force. | Highest.. 25<br>High.... 20<br>Middle... 15<br>Low..... 10<br>Lowest.. 5 |
| 3.—ABILITY TO HANDLE MEN. Consider initiative, decisiveness, resourcefulness, energy, self-control, and ability to deal fairly with his help; to earn their respect, good-will and confidence; to maintain just discipline and a staple working force. | Highest.. 15<br>High.... 12<br>Middle... 9<br>Low..... 6<br>Lowest.. 3 |
| 4.—ABILITY TO TEACH. Consider his ability to explain his work clearly and thoroughly to a beginner, to gain the beginner's confidence and make him interested in the work; his success in developing all-around men, bettering men of lower grades, and increasing generally the knowledge and skill of the help under him. | Highest.. 15<br>High.... 12<br>Middle... 9<br>Low..... 6<br>Lowest.. 3 |

| | | |
|---|---|---|
| 5. GENERAL VALUE TO THE COMPANY. Consider his years of service, his loyalty, his ability to understand and carry out the company's policies; orderliness of his department; his readiness and ability to co-operate with other departments and the management in giving new ideas and methods a fair trial. | Highest | 30 |
| | High | 24 |
| | Middle | 18 |
| | Low | 12 |
| | Lowest | 6 |

This plan, of course, can easily be changed to fit any man who has other men under him. The chief clerk in an office or the assistant manager of a department store might have different qualities and percentages which can be substituted. The sum of ratings is 100 per cent. General value to the company, the most general title, is placed highest with a rating of 30. Other qualities are considered worth 15 points apiece, except ability to plan and supervise, which gets 25.

All men in the company now coming under the plan are rated against these scales, revision of ratings taking place every three months. Salaries are based not on guess work, but on the actual ratings. An increase in total points of rating means a sure increase in the pay envelope. To show that the plan has actually increased morale, it may be mentioned that average ratings have increased about 35 per cent. in the year during which the plan has been used.

Promotions also are always made on the basis of ratings. The several candidates are measured by the scale, taking into consideration the requirements of the new position, and the promotion made absolutely on the basis of points. Thus mystery is killed off by mathematics, and the chronic grouch is left without a leg to stand on when another man gets the job he wanted.

### A Typical Case

Not long ago a new foreman was needed in the plant. On the old basis, the natural way would have been to promote the assistant foreman of the department or bring in a new man from outside for the job. Instead, the rating scales were studied and from these three possible names were selected. Two were at the time assistant foremen of departments, the third was employed not in the shop, but in a totally different department, the sales inspection. His was the job of meeting the customers who brought in cars for repair. These three men were each rated for the new position by three of their superiors independently. Then they were brought together, informed they were candidates for the position, and asked to rate each other by the same scale.

Curiously enough, at least from the cynic's point of view, the one receiving the highest estimate from the three superiors received nearly the same rating from his two rivals. It was the man holding the position of sales inspector; and he received the promotion in consequence. The three candidates shook hands all round, declared the choice to be fair, and the assistant foreman of the department, who was one of the candidates, went to work under the new boss with increased "pep"—he knew he had been given a square deal.

This brings up the most important feature in the application of the new plan—the method used in determining the ratings. To prevent possibility of unfairness, each man is graded by three people, eliminating the element of personal prejudice, favorable or unfavorable, conscious or intuitive. To reduce the influence of personality still further, a practical plan has been worked out by which all graders operate on the same basis. The comparisons for grading are made not against some nebulous ideal like a star in the Einstein theory, but against definite individuals. Observe that on the rating scale are five gradings for each qualification. Let us imagine that the particular quality is "Ability to Plan and Supervise." Quite a good quality, and one which every man has in some small or great amount. The grader runs through in his mind the names of a dozen men in similar positions, selects the one he considers to be most expert in this respect, and writes his name opposite the word "highest." He picks Pete Johnson, for example, who married his oldest sister, for this honor. Opposite "lowest" he sets down the name of the individual whose attainments in this phase of the work are least—Henry Dubb, let us say. He does the same with "middle," "high" and "low." There are now five names with abilities running from highest to lowest on this chart.

"The names of the highest and lowest," read the instructions, "must represent extreme cases—the best and the poorest you have ever known. The name for the middle should be that of an average foreman, for example, half way between the extremes. High and low should be half way between the middle and the extremes."

The grader now compares his estimate of the foreman being graded with these definite individuals. Thus he estimates that Henry Jones, who is being graded, is equal in planning and supervising ability to Dave Henderson, whose name he finds written opposite high on the schedule. Jones, therefore, receives a grading of 20 in planning and supervising ability.

In this way results are certain to be comparatively true. Foremen, understanding the method of making the ratings, are convinced that the figure is fairly arrived at and represents a correct estimate.

### Men Are in on It

Another step to kill off mystery should be noted, and it is an important one. Men are free to inspect their ratings at any time and discuss them with their superiors. Executives are enabled thus to point possible roads to development. The great virtue of the ratings here is in permitting the matter to be discussed in detail rather than in mere generalities, and giving the man the chance to develop a quality as he would a muscle.

One man who was an inspector desired to be promoted into the sales department. His rating scale was discussed with him and he was shown to lack the right kind of selling personality. Properly guided, he set out to develop an agreeable manner, and to build up on points where he was weak. Through reading, hard study and real, conscious evolution on his part he made progress. He called in the evening on men he knew who were salesmen and studied them. In four months he earned a better rating and got the promotion he wanted.

As a corollary to the rating plan, promotion charts were drawn up to indicate possible opportunities for advancement in position in addition to wage increases in positions then filled. Most men felt that, having reached a foremanship, they had arrived at the pinnacle of their career—there was nothing beyond to which they might aspire, and this feeling is general in many concerns. It is a real ambition killer. To one of these men there were shown at least five possible positions ahead if he could earn them. The promotional opportunities laid out in diagram presented them visually and impressively and gave a real incentive. One showed, for example, that when a man reached the position of sales inspector, two roads were open for him ahead, one in the direction of shop foreman, the other in the direction of sales of new cars, used cars, or trucks. In every other industry, this pointing out the path ahead is possible and it will always increase morale.

Practically all men are being promoted in this plant from the inside. Any man who has worked in a place where all good jobs were given to outsiders will realize what this means in better team-work. Promotion of a sales inspector to foremanship created five promotions down the line. Each time an advance is made a bulletin is issued announcing it. This is the kind of publicity that helps Babe Ruth knock more home runs, and the promotion is given a real dignity. It also helps to bring home to each man similar opportunities before him. These chances are talked over at home and it shows in the results at the office.

Having worked out the plan whereby a man's strength and weakness might be pointed out to him and used as a basis of pay and promotion, it was next desirable to get a practicable plan by which he might be helped to develop himself. A foreman's training school was therefore organized, attended by sub-foremen and foremen and a few selected mechanics. Attendance was voluntary, but all foremen and their assistants joined with the exception of one or two. Sessions were held once a week, in the evening. In addition, conferences were arranged between the foreman and service superintendent daily between 9 and 10 a.m., on a pre-arranged schedule,

(Continued on page 33)

# The Proper Selection of Grinding Wheels

## Two Types of Artificial Abrasives and Four Types of Band Used —Adaptability of the Two Abrasives—Grinding Action of Wheel —Variable Factors Incurred—Wheel Speed—Personal Factor

By R. N. JOHNSON*

TWO distinct types of artificial abrasives and four types of bond are used in the manufacture of grinding wheels. There are still a few wheels on the market which are made up of natural abrasives, such as emery and corundum, but these are very much in the minority.

### Abrasives

One type of artificial abrasive is made up essentially of crystalline aluminum oxide and is spoken of as aluminous abrasive. The aluminous abrasives may be recognized by such trade names as alundum, aloxite, alowalt, borolon, corowalt, oxaluma, rex, carbo-alumina, corolox and sterlith.

The other type is composed of silicon and carbide and spoken of as silicon carbide. It may be recognized by such trade names as crystolon, carbolite, carbolon, carbowalt, corex, electrolon, gresolite and sterbon. The artificial aluminous abrasives are made by fusing bauxite (a mineral containing a high percentage of aluminum oxide) in an electric furnace.

Silicon carbide is made by heating coke (carbon), silica sand, sawdust and salt together in a resistance type of electric furnace. The carbon of the coke and the silicon of the sand combine chemically, forming the abrasive. This abrasive is screened and is then ready for use.

### Adaptability of the Two Abrasives.

The aluminous abrasives are tough and more adapted to grinding all kinds of high tensile strength materials, such as soft steel, hardened and high speed steels and annealed malleable iron. The silicon carbide abrasive is hard and brittle and is most efficient when used for grinding cast iron, brass and other materials of lower tensile strength. Four different types of bond are used, namely, vitrified, silicate, rubber and elastic.

### Uses of the Different Bonds.

The silicate bond is used when wheels must be manufactured quickly, where wheels larger than 36-inch are used, and for some surface and tool grinding work. One of the largest fields is that of knife grinding, such as paper knives, pocket knives, wood working knives, etc.

Elastic wheels are used in cases where very thin wheels are required for cutting off stock and where cool cutting and a fairly good finish is desired, such as ball race grinding.

Rubber wheels are usually made of harder grades than elastic wheels. They are used where thin wheels are required on rather severe operations on which a thin elastic wheel might break. Some thick rubber wheels are used for snagging, and on rather severe operations where the strength of a vitrified wheel might not be sufficient to assure entire safety.

All other wheels, probably at least 80 per cent. of those manufactured, are made by the vitrified process and used on all kinds of cylindrical, snagging, surface grinding, tool and cutter and internal work.

### Grinding Action.

The grinding action of a wheel depends on two factors, namely, the kind and size of abrasive, and the grade of wheel. "Grade" is the term used to denote the hardness of a grinding wheel. It actually represents a measure of the strength of the bond or the cohesive force exercised by the bond to retain the grain in its setting. For each grinding job there is a particular wheel that will give best results, a wheel having a certain size of abrasive grain held together with a bond of certain strength. Grinding action is, of course, dependent on the kind of abrasive used in the wheel.

**THINGS TO REMEMBER**

Aluminous abrasives are tough and more adapted to grinding all kinds of high tensile strength materials such as soft steel, hardened and high speed steels, and annealed malleable iron.

Silicon Carbide Abrasive is hard and brittle, is most efficient when used for grinding cast iron, brass and other materials of low tensile strength.

Considering the same material—remember that the harder it is, the softer the wheel must be to cut efficiently. The broader the contact of the work to the wheel, the softer the grade should be.

Sharp fins on castings wear ordinary snagging wheels much more rapidly than flat broad surfaces, consequently they should be ground with harder and finer grain wheels.

The type of machine used is important as each type creates certain grinding conditions which must be thoroughly known in order to make the most intelligent wheel selection. Vibration in a machine should never be tolerated if good work is desired.

Several general rules govern the action of grinding wheels. These could be specified as follows:

1. Use aluminous abrasives for high tensile strength materials.
2. Use silicon carbide for low tensile strength materials.
3. Use fairly soft wheels when wheel wear can be sacrificed for production. There is, of course, a limit.
4. Coarse grain wheels usually cut more rapidly than fine ones, and consequently wear faster. There is a limit to the coarseness of grain used in wheels, governed by the material being ground and power required to make each individual grain penetrate into the material ground.
5. Coarse grain wheels will not always produce as fine a finish as fine grain wheels. However, in some kinds of precision work, a very fine finish can be obtained with coarse grain wheels, provided they are properly trued.
6. Fast cutting wheels are usually cool cutting wheels.

The selection of grinding wheels for a given job involves: first, consideration of a set of more or less fixed conditions that the wheel must fit into; and second careful attention to influential factors capable of modification or change to suit the conditions. These factors might be grouped as follows:

### Given Conditions.

1. Material. 2. Shape and dimensions of work. 3. Contact. 4. Type of grinding machine.

### Variable Factors.

1. Wheel speed. 2. Work speed. 3. Condition of machine. 4. Personal factor.

### Material.

This factor determines the kind of abrasive that should be used. Considering the same kind of material, the harder it is the softer the wheel must be to cut efficiently.

The shape and dimensions of the work, especially in cylindrical grinding will have some effect on the size, grain and grade of wheel employed. Short stiff work can often be ground with a wide wheel by feeding straight in, while long, slender work requires that the wheel be traversed, and will call for a somewhat narrow wheel and the use of steady rests.

The broader the contact of the work to the wheel, the softer the grade should be. For instance, a ring wheel employed for surface grinding is usually of softer grade than that employed for

*Assistant Sales Engineer, Norton Co., Worcester, Mass.

cylindrical grinding, while a ring wheel employed for internal grinding is still softer than that employed for internal grinding; all on account of the contact between the work and the wheel. Sharp fins on castings wear ordinary snagging wheels much more rapidly than flat, broad surfaces, and consequently they should be ground with harder and finer grain wheels.

### Type of Grinding Machine

The kind of machine employed for the various classes of work and size of wheel it mounts is important in making a selection of wheels. For example, a surface grinding machine, which mounts a rather large diameter, broad face wheel, will call for a coarser and softer grade than another type of surface grinding machine which mounts a rather small diameter, narrow face wheel. Still another type of surface grinding machine, which mounts a cup or ring wheel, will present a broader contact to the work and will, therefore require an even coarser wheel than either of the two types mentioned. Each type of machine creates grinding conditions which must be thoroughly known in order to make the most intelligent wheel selection.

### Wheel Speed

Past experience has shown that a certain range of wheel speeds gives best results for the various oeprations. The faster the speed, the harder the wheel will act, and vice versa. The more common recommended wheel speeds are given below:

| Kind of Grinding | Peripheral Speed in Feed per Minute |
|---|---|
| Cylindrical grinding | 5500 - 6500 |
| Snagging and general off-hand grinding | 5000 - 6000 |
| Surface grinding | 4000 - 5000 |
| Knife grinding | 3500 - 4000 |
| Wet tool grinders | 4000 - 5000 |
| Vertical spindle surface grinding | 4000 - 4500 |
| Elastic and rubber cut-off wheels | 9000 -12000 |

The speed at which the work is revolved in both cylindrical and internal grinding, or the speed at which it is either revolved or traversed back and forth on surface grinding, has a great deal to do with the action of a particular grain and grade of wheel. Space does not permit our covering this subject here. It can only be said that there is no fixed work speed which can be recommended, but rather it must be determined by experiment for each individual operation.

### Condition of Machine.

A machine in poor condition is naturally quite hard on a grinding wheel. The greater the vibration of the wheel on the work, the faster it will wear out, and consequently the harder the wheel must be to stand up on the machine which is in a poor condition. Vibration not only wastes the wheel, but tends to ruin the machine, and should be eliminated at all times if grinding is to be carried out most economically and efficiently with a resultant high quality of work.

### Personal Factor

The operator is the biggest factor in the success or failure of a grinding wheel or machine. He can waste wheels by being careless in the use of a dresser, by not taking care of the machine he is using, by forcing a wheel beyond its ability to cut, and by operating wheels at incorrect speeds. An intelligent grinding machine operator can usually obtain good results on a grinding operation with a range of grains and grades of wheels, provided he understands how to vary conditions, such as work speed, wheel speed and application of the work to suit the particular wheel in use.

Have you some trouble in the use of your wheels? If so see if any of these remedies will help you out. Suppose the wheel does not cut, try these suggestions:

1. If running too fast, reduce the speed of wheel. 2. Try a softer wheel. 3. Try coarser wheel if finish is not important. 4. Be sure the abrasive is the right kind for the material.

If wheel wears too rapidly, try these: 1. If running too slow increase wheel speed. 2. Try harder wheel. 3. Try finer wheel. 4. Eliminate vibration in machine. 5. Reduce pressure of work on the wheel.

If wheel does not give good finish (precision grinding): 1. Dress the wheel to a perfect cylinder. 2. Put smooth face on the wheel with a diamond. 3. Eliminate vibration of machine spindle. 4. Balance wheel if it is out of balance. 5. Use finer wheel. 6. Use elastic wheel.

For wheel loads: 1. Increase speed if below that recommended. 2. Try coarser wheel. 3. Try softer wheel.

For wheel glazes: 1. Reduce speed if above that recommended. 2. Try softer wheel. 3. Be sure the correct abrasive is being used.

For wheel burns use the same suggestions as given for wheel not cutting.

If wheel does not hold shape, use suggestions for wheels wearing too rapidly.

## PROMOTION MYSTERY

Continued from page 31

and department conferences between foremen and assistants at definite times, which latter conferences the superintendent frequently took occasion to join.

Men meeting together in this way helped iron out the hard and rough places and got to know each other better. The whole scheme is thus closely linked up and everybody knows how it works, and why.

The immediate effects of any such plan are at first intangible, felt rather than seen. There is a different attitude in the air, more loyalty, finer co-operation. Individuals have been re-made, according to their own words, in this particular plant. One was formerly a tester with a continual grouch. Members of other departments hesitated to approach him or ask for his assistance. He was a real bear. The change the plan worked in him has brought him promotion. He is now in charge of new car deliveries, a job which brings him in contact with customers. His manner, disposition and feeling are entirely reversed. The spirit of antagonism between the sales inspection and the shop departments has been knocked on the head. More work is done on time. The sales inspector who may observe something on the car while it is moving which would puzzle or escape the mechanic with the car standing in the shop, takes the trouble to write a suggestion on the other card. Each man knows he can't get ahead by stepping on another man. Team-work is the only thing that can win when a man may be rated any day by the man next to him.

To sum up, this plan of building morale consists of analyzing the individual, making his opportunity plain to him instead of mysterious, training him for the better job ahead, and killing off the occult. It is a plan of human management which can be applied to places where the usual methods of promotion study, bonus and the like are impossible. It is a plan of working for efficiency through the development of men, more than through the development of methods. It has collective bargaining lashed to the mast for fairness and development. And it removes the word discouragement from Bill Green's vocabulary, which is a good word to have removed at a time when more courage, more interest and better work all around are so essential to our national welfare.

## FACTORY LIGHTING

During the year 1915 a special committee formed by the British Government issued an interesting report on the lighting of factories and workshops. The subject was dealt with from the standpoints of the safety and health of the operatives and also of the increase of production. Largely as a result of this report the standard of illumination in the British munition factories erected during the war was exceptionally high and there was a marked improvement in the lighting of ordinary factories. The report was in the nature of an interim document, and the inquiry has now been resumed under the guidance of several experts. An investigation will be made into the general conditions necessary to secure suitable lighting in factories and workshops and into the effects of mixed and artificial lighting, with special reference to underground workrooms.

# FOR SALE

## LONGUEUIL STEEL WORKS

**the property of**

# Armstrong Whitworth of Canada, Ltd.

## Location

The plant is situated on the South Shore of the St. Lawrence River opposite the City of Montreal.

## Land and Buildings

The land consists of a tract of 180 acres with a 2,200-foot frontage on the St. Lawrence River directly opposite the Harbor of Montreal. The main line of the Q. M. & S. Ry. runs through the property within 100 yards of the main buildings, with a siding into works.

**Main Building**
1 Story, Steel Frame and Concrete.

Small Tool Dept. .....175 x 94
Carpenter & Pattern Shop 40 x 60
Tyre Rolling Mill .....275 x 60
Hammer Shop .....275 x 60

Annealing and Finishing Dept.
Rolling Mill .....275 x 60
Steel Foundry .....275 x 94

Open Hearth .....91 x 88
Crucible Dept. .....100
Repairs and Electrical Dept.

**Office Building and Stores**
2 Stories, Brick
133 x 41 ea. story.

**Laboratory**
Metal Lath and Cement
60 x 33

**Boiler House**
Steel Frame and Concrete
74 x 54

**Power House**
Steel Frame and Concrete.

**Powdered Coal Plant**
Steel Frame and Concrete
64 x 34

**Transformer House**
Steel Frame and Concrete
52 x 24

Scrap Shed, Brick Sheds, Oil House, Employees' Houses, Pump House, Freight Shed, etc., etc.

## Shipping Facilities

The St. Lawrence River frontage has not been improved but could be developed, allowing vessels to use the 30-foot deep channel running from Montreal to the sea.

The property is served with a siding from the Quebec, Montreal & Southern Ry., with spur tracks to all parts of buildings.

## Power Plant

The Power Plant consists of two 500 h.p. B. & W. Boilers; two 500 h.p. Goldie & McCulloch Boilers; two 250 h.p. Goldie & McCulloch Boilers equipped with Foster Superheaters; one Canadian Ingersoll-Rand Air Compressor, free air capacity 732 cu. ft. per minute; one Swedish General Electric Steam Driven Generator, 375 K.W.; two Bruce Peebles Motor Generator Sets, 350 K.W. each; three Transformers, 300 K.V.A., 22,500/2,200 V.; six Transformers 140 K.W. 22,500/2,200 V.

This plant is well situated for serving domestic requirements and also for export. There is a plentiful supply of skilled and unskilled labor. The Locomotive Tire Rolling Mill is the only plant rolling tires in Canada.

3—Oil Storage Tanks (underground). Oil Pumps.
1—Lime Kiln.
Etc., etc.

### PUMP HOUSE

2—Allis-Chalmers Electrically-driven Hydraulic Pumps, capacity 550 gals. per minute.

# WHAT OUR READERS THINK AND DO

## TURNING IRREGULAR FORMS

By J. DAVIES

WE recently had a considerable number of punches to be made to the form shown in Fig. 1. These were to be used in punching chain links. At the first attempt we rough turned one, leaving enough stock on to get the shape. Then we marked off the profile on the end, milled as near as we could to the lines, and filed the rest. This process was altogether too slow, so we did a little experimenting on the lathe with entirely satisfactory results. I do not pretend to know the exact theoretical method of developing cams, so will give an account of our experiments, and should any reader have any correction or improvement we shall be glad to hear from them.

First, we secured a casting from the scrap heap and machined it to dimensions given in Fig. 2. We next turned a concentric roller to suit, then fitted the bracket on the back of the cross slide of lathe so that the centre of the roller was the exact height of the centre of the lathe. We then bored a piece of cast steel 4 inches in diameter and 1¼ inches wide a close push fit for the body of the punches to be turned. This piece of steel was to be used for a cam, and could have been any convenient diameter, but it was thought that the larger the diameter the easier the action, as the amount of throw remained constant irrespective of the size of the cam.

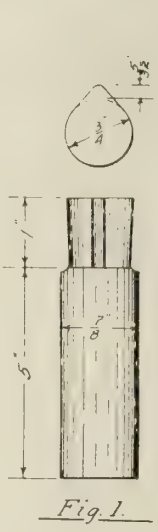

Fig. 1.

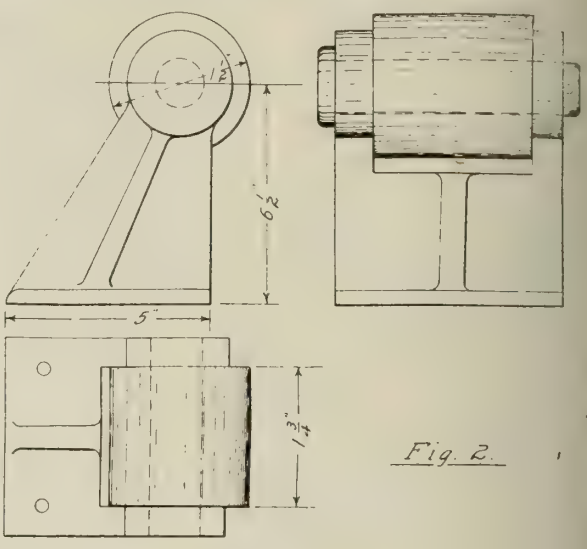

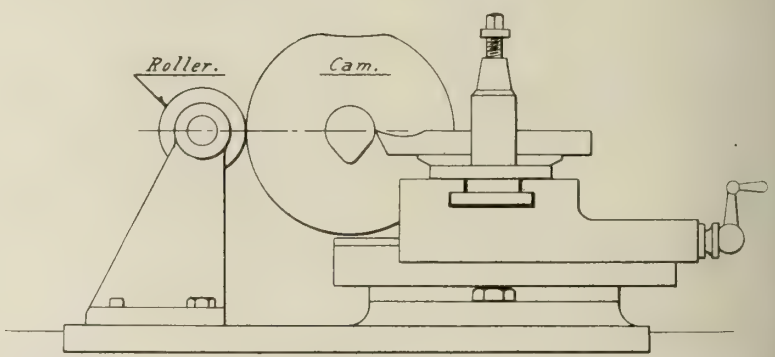

Fig. 2.

SHOWING STYLE OF CASTING USED AND METHOD OF CUTTING THE FORM.

The next step was to lay out a cam that would produce the desired shape. This was done as shown in Fig. 3. The basic principle adopted in the laying out of the cam was the fact that as the roller was constantly pressed against the cam, and the bracket carrying the roller and tool post carrying the tool were both attached to the same slide, the distance between the tool and the roller would always be the same wh measured in a straight line through centre of roller centre of cam, to cutting edge of the tool. When I this distance was constant, I mean

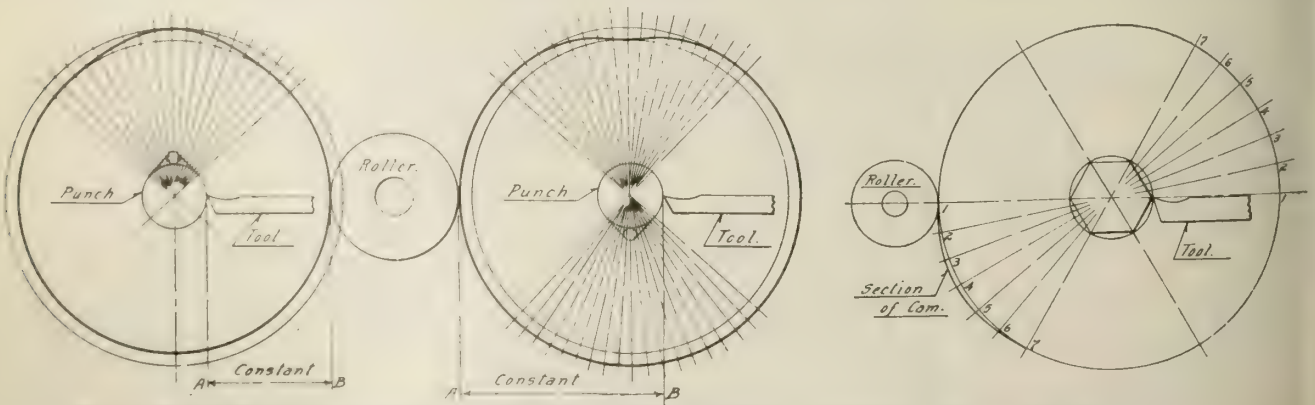

FIG. 3—THE METHOD OF LAYING OUT THE CAMS. SKETCH SHOWING AUTHOR'S IDEA OF HEXAGON CAM.

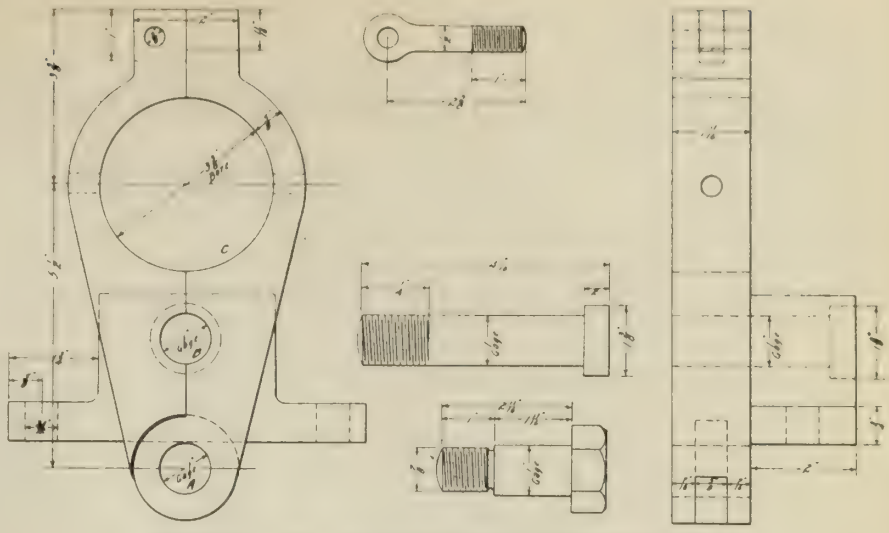


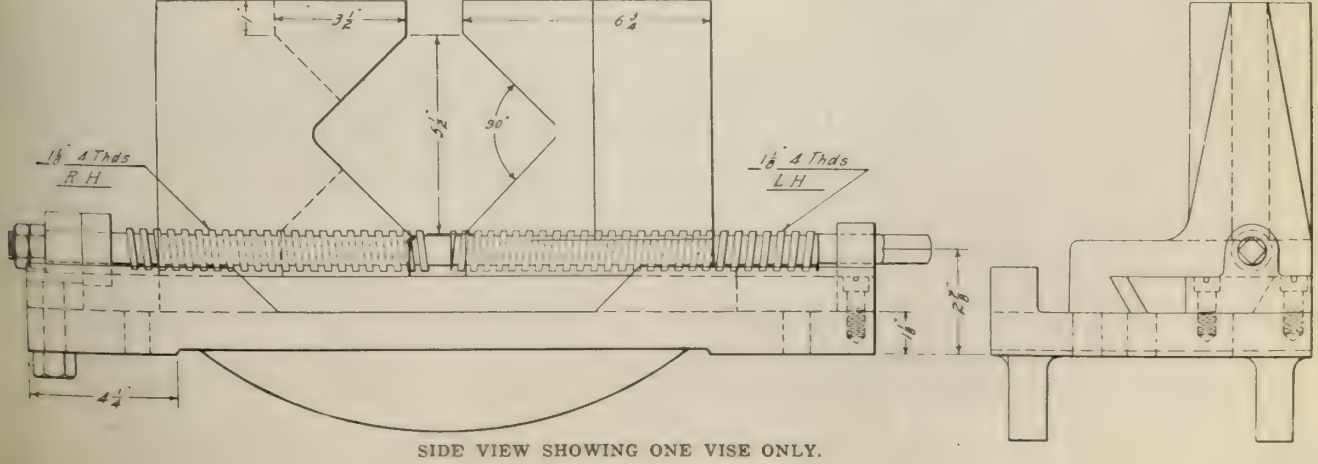
was constant during the same cut. The feed was put on by using the compound. This shortened the distance at every cut and produced a different shaped punch. So it remained for us to develop our cam to produce the right shape, and of the right size. This we did by marking off as shown in sketch, taking the distance from roller to tool as a constant when the tool was on the finishing cut, and marking off a number of lines through the centre of roller and cam to the cutting edge of tool. The number of lines is immaterial. The more lines, the more points in the curve, and consequently greater accuracy.

We next removed the transverse feed screw and inserted a strong spiral spring in its place at the back of the slide to keep the cam up to the work. The cam was fastened to the punch, being turned by a ½-inch bristo safety screw sunk below the surface, leaving enough stock sticking out through the end of cam to form the punch. This gave us an entirely satisfactory job, the punches being finished perfectly to form and size. I venture to say that by this method any irregular form can be accurately turned practically as quickly as turning an ordinary round bar. This rig would be no use to produce a single piece, but for repetition work I think it will prove very useful. We took the precaution to put taper dowel pins in the bracket at the back so that the whole attachment could be replaced on the lathe in about five minutes. We have not yet tried to turn an hexagon, but I believe it could be done and I have shown a sketch of the cam required for such work.

## BORING FIXTURE

By Cecil H. Smith

In the manufacture of a certain class of pump, it is essential that the shaft sleeves for the main shaft be very accurately bored. These sleeves vary in diameter, the smallest being 1 7/16 inches outside diameter, while the largest is 4 inches. They range in length from 4½ inches to 17½ inches, so it will readily be seen that it was quite a task to design one fixture to handle all sizes. The result is shown at Figs. 1 and 2.

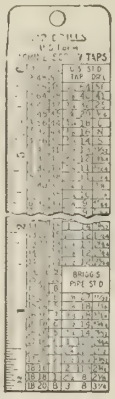


GENERAL VIEW AND DETAILS OF THE CLAMP USED.

An ordinary lathe was used, the regular tool slide being dismantled, the two vises, as shown at Fig. 1, being fastened through the medium of the regular Tee head bolts to the saddle. On the shorter brasses we used only one vise, taking off the second vise until the shorter sleeves were completed. Next let us glance at Fig. 2.

This view shows the boring bar guide, two of these being used, one at each end of the fixture. It is readily understood that these guides had to swing out of the way while inserting a new sleeve and placing the boring bar, so provision was made for so doing. The guide swings open from the pivot point A and cannot close further than the gauge point B. This pin centres the two halves of the guide, and guarantees that the boring bar is properly supported. The eye bolt at top holds the complete guide together.

A bar having a double fly cutter is used, and the bar itself is supported by a separate socket which is screwed to the spindle of machine. A standard taper hole in this socket allows all bars to fit the same socket. In some cases, the end of the boring bar is built up by intermediate drill sockets until they fit the socket on the lathe spindle. Three cuts are usually taken, a roughing, semi-finishing and finishing cut, and as these sleeves are made from high quality brass an excellent finish is secured. Since adopting the fixture production time has greatly improved, and we have no inaccuracy, the holes being perfectly round. Chatter is also eliminated, so that I can pass the idea along with perfect confidence.



A survey of the oil districts of California has been made by the United States Bureau of Mines in order to ascertain whether the visible masses of wasted oil-bearing sands would be a profitable source of supply. From the data collected, it is estimated that 2,359,100 barrels of oil, valued at more than $3,500,000, could be obtained from the sand piles about producing wells, and from the outcroppings in the vicinity of the fields. Also, many times that amount of oil scattered over nearly the total oil-producing area might be recovered from seepage—that is, the oil permitted to soak into the ground or spread over the surface. The character of these wastes and possible methods of recovery are given in a recent report issued by the bureau.

SIDE VIEW SHOWING ONE VISE ONLY.

# Improve Your Powers of Perception—Try This Contest

Below will be found twelve references to advertisements in this number. To the sender of the first correct set of answers to these we will forward one of these scales.
To win one is not difficult, and at the same time you will add to your store of knowledge. Read the details given below.

The scale is 6 in. long and is made from finest quality steel. One side is marked in 32nds, the other side in 64ths. A table of decimal equivalents is also stamped on one side, and a table of tap drill sizes on the reverse side. This scale is well worth securing.

## What You Have to Do

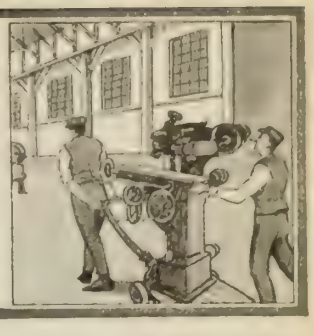
We publish every week a number of interesting facts or statements selected from the advertising pages for that week. The selections for this issue are given below. Read these through, then turn to the advertising section and see if you can pick out the advertisements to which they refer. The work is interesting, it will train your powers of perception and of memory, it costs you nothing, it will make you better acquainted with the various lines of machinery and tools in the market, and with perseverance you are bound to win one of these useful scales as a prize.

Several contestants had eleven out of the twelve questions correct, but only one reader, J. A. Scarsbrook, 307 Poplar Ave., Winnipeg, Man., submitted a correct list. A scale goes forward to him at once. Who will be the next?

**CONTEST FOR MAY 12TH ISSUE**

**Contestants are required to write us, stating to which advertisements we refer in this number.**

1 Something that requires no special vises or fixtures.
2 A product said to be always accurate and dependable.
3 A product that has been turned out in thousands during the past 11 years.
4 How to solve a certain kind of problem.
5 A case where you are requested "Not to Wait."
6 Something that is a special feature. It is made in Canada.
7 A product that is made in one grade only.
8 What to do if you come from Missouri.
9—A product said to be long-lasting under hardest use.
10 A new discovery that works very quickly.
11 Something that has seven features.
12 How to get accurate production.



**These are Correct Answers for List from April 21st Issue:**

1—Geometric Tool Co.
2—Diamond State Fibre Co.
3—Shepard Electric Crane & Hoist Co.
4—Hamilton Gear & Machine Co.
5—Aikenhead Hardware, Ltd.
6—H. W. Petrie, Ltd.
7—Canadian Link-Belt Co., Ltd.
8—Canadian Hart Products Co.
9—Ingersoll Machine & Tool Co.
10—J. C. McLaren Belting Co.
11—The Torrington Co.
12—The Toledo Machine & Tool Co.

## Closing Date for This Contest is June 2nd

# DEVELOPMENTS IN SHOP EQUIPMENT

## VARIOUS LINES

The Selson Engineering Co., Ltd., 85 Queen Victoria Street, London, England, have given us some interesting information regarding three of their lines. At Fig. 1 is shown their 13-inch swing, vee bed, gap lathe. This machine has a bed of strong section, and the headstock has steel reverse gears. The spindle is of .5 carbon steel, large diameter, and is accurately ground to size. The gear box has three changes of feed and the gears are totally enclosed.

The apron including most of the bearings is cast in one piece and carries self-acting, sliding, surfacing and screw cutting mechanism. The standard equipment can be varied by the omission of the tray, the substitution of an American type tool post instead of the four-tool turret tool post, and also of a quick change gear box for the semi-quick box. The lead screw can be made metric if required or 127-tooth change wheel added as an extra.

### Heavy Cut Shaper

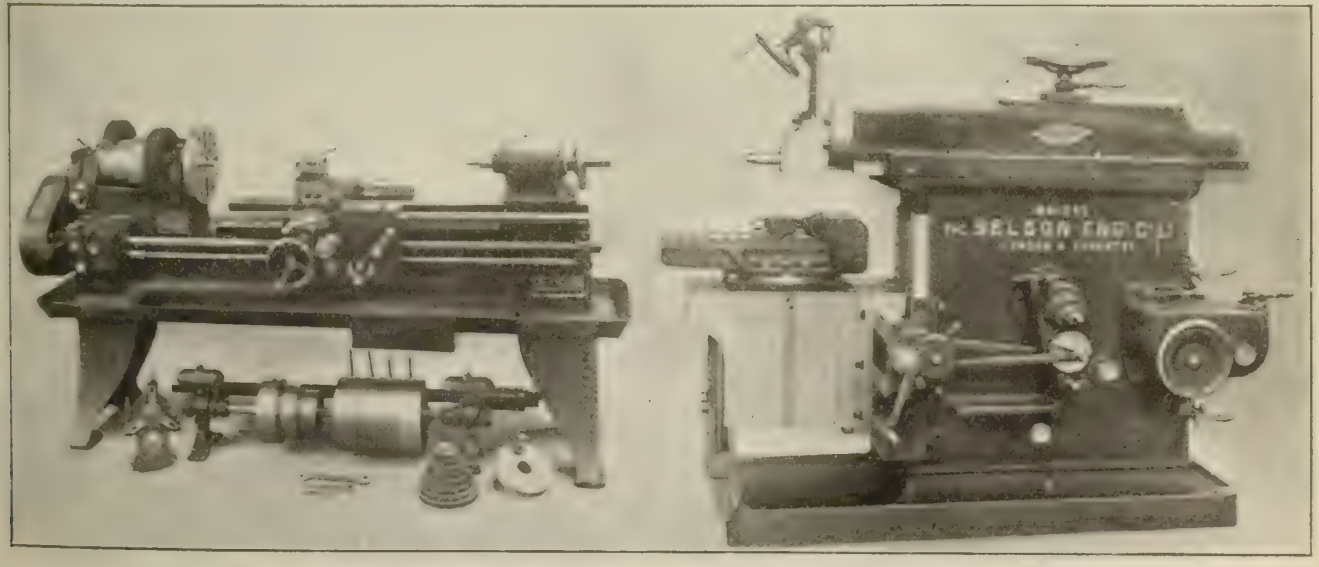
The shaper shown at Fig. 2 is capable of running at high speed and taking heavy cuts. The ram adjustment is secured by a hand wheel, rack and pinion, while a locking lever is placed directly under the wheel as shown. An index for the stroke is provided, and the stroke adjustments can be effected at rest or in running condition.

The feed motion is of original patented design and the moving parts of the feed mechanism are brought to rest by depressing a hand lever when the machine is running at any speed, thus allowing the feed to be altered or reversed in perfect safety without stopping the machine. Single pulley, cone pulley or motor drive can be used on this machine.

This concern also produce a patented central-thrust high speed radial drilling machine which contains some very interesting points in design. The carriage of these drills is gibbed to the front and underside of the arm. The front plate carries the top bearing of spindle, driving gears and feed mechanism, while the under plate forms the lower bearing and takes the central thrust of the drill.

On the six-foot machine a fine radial adjustment is placed on the carriage and the operator can control all motions for setting the drill without leaving his working position. Other parts are likewise well designed, but for lack of space we cannot enter into further detail.

## INTERESTING TOOL HOLDER



A special tool and holder, known as the "Twisto," that has several points of interest is now offered to the trade by John H. Hontstream, of Hartford, Conn. The cutting tool, which is held in a special holder, is in the form of a short length of steel with helical grooves, similar to a twist drill. It is thus provided with six separate cutting edges. The bits are furnished in 2-inch lengths and it is claimed that each bit will provide 6¾ inches of cutting length. When sharpening only the ends are ground. A special holder is used for clamping the tool bits and it may be adapted for the holding of the shanks of forming cutters.

## OPEN-SIDE CRANK PLANER

The Automatic Machine Co., of Bridgeport, Conn., have placed on the market a new model of their open-side planer especially adapted for tool-room work. The machine is equipped with a combination clutch and brake mechanism, which provides for instantaneous starting or stopping of the table without changing the direction of rotation of the motor or countershaft. When starting the machine the brake is released immediately the clutch is engaged and vice-versa. Drive is transmitted from the friction pulley through sliding gears to the bull wheel and crank that drive the table. Driving shafts are fitted with ball bearings. Quick return stroke is provided for the table.

## PRESSED-STEEL PLATFORMS.

Pressed-steel platforms for use with elevating trucks are now being made by the Powell Pressed Steel Company of Hubbard, Ohio. These platforms may

GENERAL VIEW OF A 13" LATHE, ALSO A HEAVY CUT SHAPER PRODUCED BY THE SELSON CO.

be of any desired size, limited only by the size of sheet obtainable. The strengthening ribs are placed six inches apart and are ¾ inch by 1½ inches. The clearance space ranges from 6½ to 12 inches. The platforms may be made of any desired material, but the usual practice is to use 7, 9, 10 or 12 gauge stock. A platform made of No. 9 gauge steel will carry a load of about six tons. Containers of any special shape or size may be spot-welded to the top of the platform.

## NEW DRILL CHUCK

The Jacobs Manufacturing Co. has placed a new drill chuck on the market, this to be known as the "Jacobs' Super" chuck. This is a specially patented chuck and the body is made of a steel of special process, deeply case hardened. Through a special process in the heat treating, the taper hole is left soft, fitting it for use on a hardened and ground arbor. This taper hole is ground to give perfect accuracy. A hole is drilled and tapped through the centre of the body and fitted with a threaded plug which may be easily removed with a screwdriver if it is desired to insert rods or other material through the chuck. The taper holes on the chucks are of the same dimensions as those of the previous design. Through careful design the weight of the new chuck has not been increased. Each of these chucks has been designed to meet the changed drilling methods of the last few years with relation to design, weight and capacity. All needless weight has been eliminated.

Ball bearings inserted between the nut and the body reduce friction to a minimum, making it possible to redesign the thread on the nut and the jaws with a coarser pitch. Reduction of friction makes it possible to tighten the chuck with greater ease than formerly, preventing undue wear on the keys, sleeves and other parts of the chuck, at the same time giving greater gripping qualities. An oil hole inserted in the back end of the chuck makes it possible to lubricate all of the working parts.

According to this company actual tests have proved that this new chuck has shown that one-half the pressure on the key in tightening the chuck will produce the same results as in chucks of the previous design. The change in pitch of the thread on the jaws has resulted in reducing by one-half the number of turns of the sleeve to tighten or loosen the chuck.

The Jacobs improved drill chuck was patented and invented in 1902. It is claimed that it was the first chuck of the toothed key and sleeve type. Previous to the invention of the chuck of the toothed sleeve and key it had been necessary to use a spanner wrench to tighten or loosen the prevailing type of chuck. The use of the toothed key and sleeve type resulted in a chuck with greater holding power, less exertion in the tightening of the chuck and the elimination of the holding of the spindle against rotation.

The new "Super" chuck was invented and patented in 1909, and later patents were issued in 1915. This new chuck in outward appearance is very similar to the old one. Its outward design has been changed slightly to give it better proportions. A number of these new chucks have been in actual service for a period of six years, during which time they have proven beyond a doubt their efficiency. They have been subjected to every conceivable test for accuracy, ease of operation and durability.

## Our Buying and Selling

FOR the twelve months ending March, 1921, Canada bought from United States goods to the value of $856,613,430. In the same period she sold to United States goods valued at $542,304,456.

In that year she bought from the United Kingdom $213,910,988 worth and sold to that country $312,842,921 worth of goods.

In our exports four lines stand out prominently: (1) vegetable products; (2) wood, wood products and paper; (3) animal products, while iron and its products come fourth, although a long way below the other three classes.

In imports, vegetable products lead as they do in exports. Then comes iron and its products. It is worthy of note here that United States still dominates this market, sending in here shipments valued at $226,862,456, against $16,698,085 from the United Kingdom. Both countries used to have about an equal share of this business, but in 1920 it stood 16 to 226 in favor of United States.

The fourth largest item in imports was fibres and textile products, where Britain, as might be expected, has a lead, but not so large as might be expected, considering the advantage of the preferential tariff.

In the period mentioned, Canada imported goods valued at $1,240,125,056 and exported goods valued at $1,189,163,701.

## Where German Goods Go

THE German statistical office has been sending out some interesting figures, showing where its goods are going. The comparisons shown here are for the purpose of giving the destination of German-made goods for 1920 against 1913. The figures show percentages in each case:

| Country— | 1920 | 1913 |
|---|---|---|
| Holland | 21.2 | 6.9 |
| Switzerland | 9.2 | 5.3 |
| Sweden | 7.1 | 2.2 |
| Norway | 3.0 | 1.6 |
| Denmark | 6.1 | 2.8 |
| Finland | 1.7 | 1.0 |
| Spain | 2.5 | 1.4 |
| Austria-Hungary | 7.8 | 10.9 |
| Balkans and Turkey | 1.1 | 3.1 |
| Russia and Poland | 2.5 | 8.7 |
| Great Britain | 6.4 | 14.3 |
| France | 3.0 | 7.8 |
| Belgium | 3.1 | 5.4 |
| Italy | 3.0 | 3.9 |
| Other European Countries | 5.1 | .6 |
| United States | 7.2 | 7.1 |
| Other Extra European Countries | 10.1 | 16.9 |

## Hard to Hold Men's Confidence

IT is nothing new to have a manufacturer state that one of his hardest problems now is to get and hold the confidence of his men.

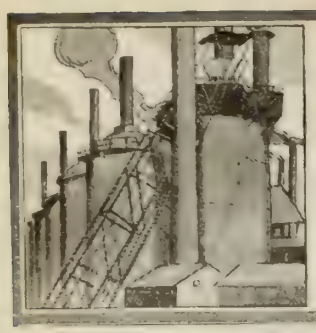
Several of them have stated almost this same fact to this paper. One manufacturer, speaking of this matter, said: "When a deputation comes in here from the shop now to talk to me one of the things that hurts me most is the sensation, openly and plainly conveyed to me at times, that they do not believe what I am saying about the condition of my business."

There is a very pressing need for a common ground to be established where employers and employees can meet in the fullest confidence.

This is not common to the steel or iron working industries, but employers in other lines will tell you the same thing, viz., they feel that they are not as close to the workshop as they used to be.

There are cases where access to the books of the company is demanded before the men are prepared to accept the claims put forward by employers.

Other firms are finding a way out, but they are finding the same difficulty stated above.



The problem is simply one of making living costs and wage costs come down step for step, and it is a bigger problem than this country has yet successfully solved.

## The U.S. Steel Corporation Cuts Wages

THE United States Steel Corporation has cut its wages 20 per cent., making the second reduction in wages since 1904. In the intervening time there have been numerous increases, sufficient to bring the 1920 average wage to $6.96 per day, as against $2.68 in 1912. The 20 per cent. reduction will leave the average daily rate of the Corporation $5.57.

The steel market is inclined to be critical of the manner in which the Corporation has made the move. A month or so ago its selling prices were cut and the market had reason to believe prices would stay on that basis for some time. Now comes the cut in wages and immediately buyers ask "Will there be further cuts in the price of steel?"

It looks as though there were ground for the belief that it would have been better to make both cuts together, selling prices and labor costs. Had this been done the market would have been spared the chance to start asking questions again about probable declines.

# MARKET DEVELOPMENTS

## Steel Mill Average 31 per cent This Week

### Reduction of Wages Causes Some Questioning in the Market—Price Cutting Still Bothering the Markets in Toronto—Fair Orders Have Been Secured by Machine Tool Dealers in This District

DULLNESS is the outstanding characteristic of the trade in steel, iron and machine tools this week, but in spite of it some firms report receiving very fair orders, while a number of others have prospects that look certain for real business in a short time. Prices in a number of special lines are being cut to some extent, while firms that find themselves with too much stock in certain lines of small tools are making the prices attractive enough to move them.

Price-cutting in the steel market of Toronto is also a well-established fact and just now most of it seems to centre around the bar mill material. Some of this is due to the fact that dealers find that they still have too great stocks of certain lines and are anxious to keep on liquidating. Then buyers are well aware of the anxiety to do business and they are doubtless taking full advantage of it being very much a buye market yet. There is a certain amount of questioning in t steel market as to whether there will be an adjustment prices to follow the cut in wages of the Steel Corporation e ployees of 20 per cent. These questioners forget that the pri of steel was cut before the rate of wages. The Steel Corpo tion is, at the reduced wage, paying an average of $5.57 p day, against $2.56 in 1912.

There have been a few bright spots in the scrap met market in United States, but they were short lived and t general tendency of the trade all over the continent is dull wi little volume of business moving. Prices quoted, the deale claim, are purely nominal, and if they find occasion to bu they will pay the amount. If not, they are simply out of t market entirely.

## SOME MONTREAL FIRMS SEEM TO BE GETTING SOME VERY FAIR ORDERS

Special to CANADIAN MACHINERY.

MONTREAL, May 12.—Industrial conditions in this district have not developed an active strain of late, as a summary of various reports exemplifies the pronounced quietness that prevails in all quarters. Railroad shops are operating spasmodically—on for a few weeks and off for a week. The curtailment of shipbuilding operations at the Canadian Vickers has added to the depression in marine circles. Despite this, however, reports of some dealers in mechanical equipment indicate a slight increase in orders received. Generally speaking, it seems that dullness is still the ruling factor.

#### Steel Prices May Decline Further

Apart from the expectation on the part of some dealers that steel prices may be subjected to a further reduction before many weeks have passed, the situation differs little from that of other weeks this year, where the outstanding feature has been expressed in the term, "Little doing." A factor which may have an early influence on the market is the fact that American steel producers are facing the possibility of competition with European manufacturers of steel. Commenting on this phase of the situation one dealer here stated: "It is possible now to secure steel products laid down in Canada from Belgian mills at 50 cents a ton less than it would cost to obtain the same from United States producers. This is a condition that must be considered, and with this prospect facing the trade it is not anticipating too much to expect lower quotations in the near future."

The labor situation has become less acute and this will doubtless assist business operations, provided construction can be started on a greater scale. "Many mills in the States," said a dealer, "are only working a couple of days a week. The practice is to shut down until sufficient orders are in to run the mills for a few days, and when the steel has been made, the plant is again closed for a week or two."

A manufacturer of wire rope stated that they had received an inquiry for a substantial supply of rope, but that owing to it being for a size beyond their capacity they had to pass it up. This firm, however, has reported some good business during recent weeks. A conc tion that will eventually aid in the qui return to normal activity when busine operations are again accelerated is t depleted state of many factories. Whi speaking to a master mechanic of plant here last week the writer wa given a little insight into shop condition A workman came up and requested se eral incandescent globes and was i structed to secure them from other part of the shop. Another request was for dozen shovels, but after considerable dis cussion the requisition was reduced t six. "This," explained the m. m., "ha been the policy for several months. W are not buying anything but what is abso lutely essential; giving to one depart ment at the expense of another. Whe business comes back to normal we cer tainly will have a lot of buying to do."

#### Non-Ferrous Lines Improve

With very few exceptions the old ma terial situation continues to reflect th dullness that has dominated the marke for many weeks past. The only varia tion from previous solitude is the slight activity reported in non-ferrous scraps and it is only by turning the good ear in the right direction that the ring of business can be heard. The small increased movement is almost entirely confined to the copper lines and dealers

re do not think the demand will last. ·ad is the only metal showing strength, having advanced ¼ cent to 3¾ cents r lb. New brass cuttings are quoted ½ cent off at 6 cents per lb. Medium ass shows a similar decline at 4½ nts per lb. Red brass turnings at 7¼ nts is ¼ cent easier. Little demand is ported on steel lines and weakness in notations is developing. Wrought iron cles are down to $20 per ton, car heels $22 per ton, and stove plate $17, ıe decline of the latter two being $3 er ton.

## 'ORONTO MARKETS HAVE FEW SALES

### rice Cutting Has Been Going On in Steel Market—The U.S. Corp. New Wage Scale

ORONTO.—Several aggressive dealers are taking considerable satisfaction out of the fact that they have been ble to do a lot of service and missionry work during the past months, and hey seem to be quite certain that the ime is not far distant when they are going to realize on these efforts.

There have been some orders placed luring the week, and although the busiess was not very large, it was new quipment all through. Dealers still ınd it very necessary to make certain f the financial standing of customers, s several cases have been reported durng recent weeks of surprises that have ıeen sprung on some of the houses.

"We have done a lot of work in the ast six months," remarked one dealer his week, "and were it to be judged by he returns we have received so far it ıust be reckoned as a rank failure, but ve are satisfied that judged by results a few months from now it will be called a complete success." This same dealer aims that it is a good stroke of busiess to keep in touch with the users of our equipment after it is put in operaon. Several times he has found maines that, from lack of tooling or spe-al equipment, were not producing anyhing like capacity. This has been drawn o the attention of the purchaser of the achine, and recommendations made ing certain lines. The result has been hat the machine does exactly what is ormed for it, whereas were it left alone might drop back to the pace that ome of the operators might set for it.

#### Right After Business

One of the paper companies in Northn Ontario was receiving tenders for number of conveyor systems during the ast week, and seven firms were represented in going over the figures. Bidding was brisk, as the business was large enough to be desirable.

In other lines the same thing is experienced by the salesmen. Where there is chance of anything being placed, the buyer has a number of very good options before placing the business.

#### Cutting in Steel

Toronto steel warehouse men will tell you very plainly that the local market is about as ragged as could be imagined. Prices are being cut and the cuts made are fairly deep at times. The price pruning seems to centre around bars more than any other line, and although efforts have been made at various times to bring the market to something more like a standard, efforts have failed. Some of the merchants have stocks on hand yet that they are anxious to dispose of, and the only way just now is by making the price do the moving. As long as liquidation is being indulged in quite freely the chances of making anything like a uniform market seem quite remote.

Selling has been going on in small lots; and the orders placed are for much smaller amounts than usual. It all tends to make business more expensive to conduct, as it takes more office work and more trips in delivery.

Representatives of Philadelphia mills are in this district looking for business. One of the salesmen stated that he understood from some reports he had seen that buying in Canada was better than in the United States, and he came over to get in on the business that he thought would be moving. He went back after finding that there was nothing in this field for the present to interest him.

#### The Cut in Wages

In the steel market one hears the question: "Will there be a cut in prices of steel following the reduction in wages of the United States Steel Corporation?" There has been a lot of publicity given to this point, one of the Toronto papers using the following:

"It is taken for granted that further cuts in steel prices will follow the wage cut, which reduces the price of steel by about $8 per ton."

Local representatives of the United States Steel Corporation stated that they had heard nothing at all about any contemplated changes in the schedule of prices and pointed out that the price of steel had been cut first and the price of labor after, whereas they both had a close relation.

Other steel merchants expressed the belief that it was a mistake to make two moves on the subject. "If the Corporation had cut their prices and the price of labor at the same time they would have done a much better piece of business. As it is we have this unsettling element in the market again, and people are asking whether there is going to be a further reduction, whereas a week ago it was generally accepted that the price was going to stand for some time."

## POINTS IN WEEK'S MARKETING NOTES

**Pittsburgh reports that the total operations of the Corporation and independent steel mills average 31 per cent. of capacity this week.**

—

**Furnace men estimate that in the majority of districts consumption of pig iron is equal to the rate of production.**

—

**U.S. Steel Corporation cuts wages 20 per cent. and market asks if this means cheaper steel. Prices were cut about a month ago.**

—

**Some salesmen from Philadelphia steel mills were in this district looking for orders, being under the impression that business was fairly good here.**

—

**Steel merchants in Toronto claim the market is being cut all the time in order to secure orders. Bar mill material is just now the center where most of the cutting is taking place.**

—

**This should be the season of the year when reinforcing material would be in demand, but warehouses report sales as being very small and confined mostly to government contracts.**

—

**Scrap market has had a few flashes in U. S. points, but they died quickly. Values are unchanged in Canada. Sellers are not taking on much and holders, if they are able, prefer to hang on for better prices.**

—

**Machine tool market remains spotty. A few very fair orders have been secured during the week.**

## TRADE OPENINGS IN ARGENTINA

### Mr. Pollard Is In The City For a Time Looking For Suitable Trade Connections

H. Pollard, who has been spending some time recently in Argentina as the representative of the Handley-Page Co., is in Toronto. Mr. Pollard, during the war, was sent to this country as an instructor in the mechanical and engineering departments of the big Leaside flying camp. He made a splendid record while there. During his stay in Canada Mr. Pollard contributed a number of articles to Canadian Machinery and also published a handbook for the use of airplane mechanics. Leaving here at the conclusion of the war he returned to England for purposes of demobilization, and has since been with the Handley-Page Co. For a time he was on the London to Paris trip, then in Spain and

Portugal for a time. Following this he went to Argentina and Uruguay for the same company, and was successful in placing some thirty of their machines.

Mr. Pollard has been impressed with the opportunities there are in Argentina for Canadian lines. United States firms and British houses are well represented there, but not so with Canadian companies. He is in Toronto at present and has been in touch with several engineering and machinery lines, openings for which he believes exist in Argentina. Mr. Pollard for the present is staying at the Gladstone Apartments, 225 Gladstone Ave., Toronto (phone Parkdale 3222) and if there are any Canadian manufacturers interested in having their lines placed in that country Mr. Pollard can be communicated with as above.

# U.S. STEEL MILLS ARE RUNNING AT ABOUT 30 PER CENT. CAPACITY

Special to CANADIAN MACHINERY.

PITTSBURGH, May 12. — Production of pig iron in the United States is now at the rate of about 14,000,000 tons a year, which compares with rates of 39,000,000 tons last October and 40,000,000 tons in March, these being the two high months of the year. Actual production as officially reported was 36,925,987 tons in 1920 and 39,434,794 tons in 1916, the record year. Thus the present rate of output is extremely low and indeed is lower than the actual production in any year since 1900. By comparison with capacity the showing is still worse, for the capacity is considerably in excess of outputs previously attained. In 1916 there was production approximately equal to the existing capacity, but since then the capacity has been materially increased, for very little of the war-time construction became effective in 1916. Last year there was an effort during the first eight or nine months to make maximum output, but transportation difficulties prevented any full attainment, chiefly through causing a shortage of coke.

The capacity is fully 45,000,000 tons, this figure not representing theoretical capacity, but the actual production that could undoubtedly be realized if there were reasonably fair manufacturing conditions, such as existed in 1916, and were normal before the war, including proper transportation service and an adequate supply of efficient labor. Compared with 45,000,000 tons capacity the present rate of production of 14,000,000 tons a year is 31 per cent.

The merchant blast furnaces make a much poorer showing than the steel works furnaces, since the merchant furnaces are producing at the rate of only about 2,000,000 tons a year, their capacity being approximately 12,000,000 tons, so that their rate is only about 17 per cent. The steel works furnaces are producing at about 12,000,000 tons a year, or 36 per cent. of their estimated capacity of 33,000,000 tons.

The chief reason the merchant furnaces are operating at a much lower rate than the steel works furnaces is not that there is a much smaller demand upon the malleable and gray iron foundries, steel foundries and detached steel works that use merchant pig iron, as compared with demand upon the steel works that have blast furnaces of their own, though there may be a little difference in this respect. The difference is due chiefly to the existence of stocks of merchant pig iron in the hands of both producers and consumers. The steel works that have blast furnaces naturally do not stock pig iron to any extent, partly because they do not buy or sell, and partly also because they normally use molten iron, which is much more economical, and make it as they consume it. In the case of merchant iron, on the other hand, consumers normally carry stocks and some months ago these stocks increased, while the furnaces also have stocks. A blast furnace must either run or not run and the merchant furnaces are either single or in small groups. As demand slumped off suddenly the average furnace, before blowing out, shipped all the iron on contract that the customers would take, and also made up some stocks preliminary to blowing out. Numerous furnaces announced late last year that they would not make any stocks, but that on account of high costs they would blow out as soon as they became unable to ship their make, but in practice the theory was violated.

### Not Stocking Up Now

The conclusion from all this is that the rate of consumption of merchant pig iron is in excess of the current production and that as stocks are consumed a steadier market will develop. That there will then be higher prices than those now ruling is a possibility but it is somewhat more likely that prices will decline further before there is an upturn. A factor that may intervene before pig iron prices tend to stiffen is that of freight rates on ore, limestone and coke. These are expected to come down and that would decrease furnace costs. It is fairly safe to make one prediction, that before the end of the year there will be an advance in pig iron, from whatever low point is meanwhile developed. That is, some pig iron is likely to be sold at lower prices than the price that would encourage an idle furnace to blow in. An idle furnace does not lose much money, while it is very awkward to have a furnace in blast and making a fresh cast of iron every six hours, Sundays included, if there is no market for it. Accordingly there will have to be inducements before idle furnaces blow in.

### Steel Market Stagnant

The steel situation is no worse than it was, but it looks worse because there was good reason to expect an increase in mill operations on account of the price changes in the second week in April. At that time the independents advanced their prices and the Steel Corporation reduced its prices, resulting in the equalized market that is now steadily maintained. As the independents are withdrawing their lower prices they cleaned up all the new business in sight at the lower figures, and this was expected to give them a better operation though of course only for a time. The Steel Corporation, on the other hand was in line to receive heavier specifications from its regular customers, having old contracts, since the contract figures were revised when the Corporation reduced its prices.

In neither case has there been an increase in operations, and naturally this is disappointing, though fundamentally the situation is no worse than it was a month ago. The independents are operating at about 30 per cent. of capacity and the Steel Corporation at about 35 per cent., making an average of about 33 per cent. for the whole industry.

While 33 per cent. is a very low rate the tonnage itself is not so bad. What has been intimated about pig iron as to increase in capacity, holds more strongly still as to steel, for there has been a 50 per cent. increase in steel capacity since 1914. Thus a 33 per cent. operation now is the same tonnage as a 50 per cent. operation would have been in 1914, while it is equal to a 66 per cent. operation with the capacity of almost twelve years ago and a 100 per cent. operation with the capacity of eight or nineteen years ago. One may say that the steel capacity has grown too fast for present conditions, and in a sense that would be true, but at a long range view the more reasonable opinion is that conditions as to the consumption of steel are not what they should be, being distinctly unfavorable. The artisans in the building trades are unwilling to work hard and want more wages than investors feel it safe to tie up in construction work. It costs too much in wages to keep the railroads going, on account of high rates and too many men on the payrolls, and the railroads cannot make improvements that the country needs. Thus it is all along the line.

While steel prices are absolutely unchanged since the equalization some four weeks ago, pig iron is easier. The \$24, valley, quotation on foundry pig iron, intimated last week as a possibility, has become an actual fact, and perhaps \$24 could be shaded a trifle. Basic iron has again sold at \$22.50, with a rumor that \$22 has been done or could be done.

The Portsmouth, O., blast furnace that recently bought a five weeks' supply of Connellsville coke, 500 tons a day, at $5.50, has renewed the contract for 30 to 60 days at $3.40. Foundry coke remains quotable at $5 to $5.50.

## Scrap Metal

Pittsburgh reports that the improved tone of the market noted a week ago is maintained due to the fact that a number of the independent steel companies have put on additional open-hearth capacity in the past week, and that they are more interested in supplies of scrap than they were a very short time ago.

Consumers have been in the market during the week at Chicago, and while they have not made large purchases they have purchased sufficient quantities to advance the prices of a number of grades.

On the New York market, the heavy melting steel consumer in eastern Pennsylvania, which came to the market recently for considerable tonnage, is reported to have filled its requirements. Business is at a very low ebb, and there is talk among some dealers of shutting down yards until there is greater activity.

The interest at Buffalo, which has bought approximately 5,000 tons of heavy melting steel in the past month, is reported willing to buy up to 10,000 tons at a $13 price.

The spurt of buying which was noted last week at Cleveland was short lived, and the market has again settled down to a generally inactive state.

## Pig Iron Market

The April output of pig iron was a daily average of 39,768 tons, or less than any daily rate since July, 1908, when the country's capacity was much smaller. Fifteen furnaces were blown out or banked in April, but nine were blown in.

Little of interest has taken place on the Pittsburgh market during the past week outside of an additional purchase of 2,000 tons of basic by the Sharon Steel Hoop Co. at $22.50, furnace, from a valley steel maker.

On the Chicago market melters are buying from hand to mouth and orders of 100 tons or more are the exception.

Prices as low as $24, base, on eastern Pennsylvania and Buffalo iron, and $22 for No. 2 southern have been rumored on the New York market, but no transactions are reported at these low prices.

Though there is little life in the Cincinnati market, the feeling is better. Shipping instructions for iron held up are being received.

Boston reports that the Sullivan Machinery Co., Claremont, N.H., this week closed on 100 tons Pennsylvania malleable, 100 tons eastern Pennsylvania silicon 2.25 to 2.75 and 100 tons Virginia No. 1-X iron at private terms. Other sales were confined to an occasional car lot.

Little activity developed during the week at Cleveland. Owing to intimations from buyers that foundry and malleable iron can be bought at considerably lower than recently quoted prices, the market is in a rather unsettled state as regards prices. One sale was made of 500 tons of malleable iron to a Barberton foundry and the purchaser got a price lower than $24.

No improvement is noted in the demand for pig iron on the Philadelphia market. Sales of carloads and 100 to 300-ton lots predominate and purchases are almost wholly for prompt shipment, though a few buyers are apparently willing to cover for two or three months ahead at present prices. Sellers, however, are not willing to sell ahead, as they hold that if prices should decline further the buyer would insist upon a revision of price on his contract, but would not consent to an advance should prices go up.

## LET RAIL ORDERS ONLY "AT A PRICE"

**Matter Came Up During a Debate on the Matter in the House at Ottawa**

OTTAWA.—That certain individuals were given to attempting to use political influence to secure contracts for ties, and that it was the business of the committee to frown on such practices, was stated before the special Parliamentary Committee on Government-owned railways and shipping by Hon. T. A. Crerar, Progressive party leader.

While Mr. Crerar had every sympathy with the farmers "getting out" ties, the railways must be run on well-accepted business principles. Railway officials would not be fulfilling their duties if they permitted themselves to be influenced.

**Buy in Best Market**

R. C. Vaughan, vice-president and director of purchasing and supplies for the National Railways, said the ties were purchased where the price was favorable to the railways. Other supplies were purchased on a similar basis. Mr. Vaughan gave an explanation of the purchasing methods, and said the directors did not interfere, except in the case of extra large purchases.

Later Mr. Crerar said a section of the public looked on the National Railways as a cow that could be milked, and he, for one, objected to being an agent between the public and the railway even for his own electorate. The public would do its business direct with the company.

**Compare Rail Costs**

Mr. Vaughan informed Mr. Murphy that few rails were purchased in the United States. The United States price was $48.60 a ton, and the Canadian price $67 a ton. The Canadian price was lower than the United States rails when exchange, duty and freight were considered.

Dr. Reid said the Canadian companies reduced the price to $60 a ton. This price, however, was considered unfair, as the directors of the road thought the Canadian price should not exceed the American price plus duty. The Algoma Steel Co. agreed to this, and took a contract for 55,000 tons at $55 a ton.

So far the Dominion Iron & Steel Co. had not "come to time."

## HARDER TO HOLD MEN'S CONFIDENCE

**Manufacturer Tells Of Case Where His Men Asked For Records To Prove His Words**

A manufacturer who takes a great deal of pride in his business, and who has always tried to make conditions as desirable as possible around his plant, discussed an interesting point with Canadian Machinery.

"One of the hardest things I have to do," he remarked, "is to get a basis on which to deal with the men in my own shop. I do not know exactly what is the trouble, but I have a well fixed belief that when I meet my men in conference regarding business conditions and matters of wages there is an element of suspicion that makes it harder for me to make progress. Just a few days ago there was a committee in here and we went over the situation in detail. I stated the case as fairly as I knew how, and I proposed just as small a cut as possible because I realize that the cost of living is still pretty well up. When I was through I was met with a request that I produce my books and the records of my business office in order that the men might verify the statements that I had made. I know this is a day when there is not much sentiment in business, and when people are generally held to be robbers until they are found to be not guilty, but that was the hardest thrust I ever received. I haven't been out in the shop since because I haven't the heart to go out, and it is one thing I miss more than anything else. I was brought up in this shop, and I know the men. I have discussed the matter with other manufacturers, and find that they have had somewhat the same experience. I don't know whether it is the men's organizations or what encourage these moves, but I am bound to confess that it is making it harder for me to feel that I have the co-operation and sympathy and backing of my men in going through a period such as we are experiencing right now."

PERSONAL AND TRADE NOTES

## UNITED STATES STEEL CORPORATION HAS CUT 20 PER CENT. ON ITS WAGES

THE long deferred action of the United States Steel Corporation in regard to the reduction of wages was taken Tuesday, May 3, when late in the afternoon it was announced that a decrease of about 20 per cent. had been agreed upon. A meeting of presidents of the Steel Corporation subsidiaries was held Monday and on Tuesday a meeting of the finance committee of the corporation was held. Shortly before five o'clock, the following statement was made by Judge Gary:

"The wage rates of day labor at the manufacturing plants of the Steel Corporation have been decreased about 20 per cent. to become effective May 16 instant. Other rates, including salaries, will be equitably adjusted.

"After long and painstaking effort, we have not been able to find a practicable basis for the entire abandonment of the twelve-hour day or turn in the immediate future. However we have already eliminated the twelve-hour day in certain departments and shall continue our eflorts in this direction with the hope and expectation of making the elimination of the twelve-hour day complete during the next year. We do not believe we can satisfy our employees with any shorter limit."

Reductions of wages of 20 per cent. were made by independent steel companies, effective Feb. 16, 1921, and independent coke operators reduced wages from 22 to 23 per cent. effective April 1.

The Steel Corporation had adhered to its schedule, which had not been changed since the announcement of Feb. 1, 1920, of the ninth advance in wages made since Jan. 1 1916. The wage advance since 1914 amounted to about 140 per cent. The following are the dates and percentages of advances of the Steel Corporation since Feb. 1916: Feb. 1, 1916, 10 per cent.; May 1, 1916, 10 per cent.; Dec. 15, 1916, 10 per cent.; May 1, 1917, 10 per cent.; Oct. 1, 1917, 10 per cent.; April 15, 1918, 15 per cent.; Aug. 1, 1918, 10 per cent.; Oct. 1, 1918, 10 to 16 2-3 per cent. (through reduction of working hours); Feb. 1, 1920, 10 per cent. The last reduction in wages was made in January, 1904, but wages were restored April 1, 1905, to the schedule which had prevailed previous to Jan. 1, 1904.

The average salary or wage per employee per day of all employees, exclusive of general administrative and selling force has been; 1912, $2.68; 1913, $2.85; 1914, $2.88; 1915, $2.92; 1916, $3.29; 1917, $4.10; 1918, $5.33; 1919, $6.12; 1920, $6.96.

## Engineering

The Nukol Fuel Co., Ltd., 88 Bay Street, Toronto, are contemplating the erection of a factory.

Plans are prepared for a garage to cost $20.000 for A. Clancy, c.o. P. L. Davis, architect, 157 Danforth Avenue.

The erection of a woodworking factory costing $10,000 is planned by McCulloch Bros., at Derbert, N.S.

The Special Auto Service Co., Hamilton, Canada, will alter building for garage at a cost of $10,000 and will also erect a garage on Dundurn St. N.

Feather and Roadhouse, 11 Foster Place, have received the sheet metal contract for alterations and additions to building for offices costing $50,000 for the Consumers' Gas. Co., 19 Toronto Street, Toronto.

## Trade Gossip

**Wants Shop Equipment.**—Harry M. Bell, R. R. No. 2, Wallenstein, Ont., wants to secure a complete emery grinder and some general shop equipment.

**Wants Equipment.**—P. E. Nesseth, of Mattawa. Ont., wants to secure the following, used or new: vise, 4 to 6 in. jaw, swivel or rigid; drill press, to take square or round shank up to ⅝ in.; double emery cylinder head to take 10 x 1 in. wheels.

**Wants Equipment.**—C. R. Wright, 190 West 101 street, New York City, wants to secure the following used equipment: Air compressor, size 9 x 8; ball mill, 4 x 5; filter press, 30 in. x 30 in.; (Shriver or similar type) 48 wooden frames and plates, open delivery. This equipment is to be used in Canada.

**Opening Office.**—In charge of Morri P. Shea, the Dominion Steel Product Limited, Brantford, have opened an of fice at 416 St. James St., Montreal. The are installing a stock of lighting sets an accessories as well as Darling valves an hydrants and other products.

**Change Management.**—As the resu of a recent re-organization, Wellan Machine & Foundries, Limited, Wellan will operate under the management c Wm. Edestrand, at one time with th Dain Manufacturing Co., and an exper enced foundryman.

**Will Change Foundry.**—Hillis & Son Halifax, N.S., are still operating in temporary foundry, following the explo sion of December, 1917. The new four dry will be of brick or concrete, an much larger than at present. As soo as conditions warrant they will be adc ing to the plant and equipment in dif ferent directions.

## CONDITIONS IN BRITISH FIELI

C. W. Field, representative in thi district of the British Overseas Trad Organization, has returned from a extended visit to the Old Country, dur ing which he called on a great man firms there that had been doing busines in Canada. In many cases the busines had been carried on in a half-hearte way, the firms there not realizing th importance of the Canadian market, no appreciating as they should the purchas ing power, per capita, of the Canadia people.

"I found," remarked Mr. Field, "tha the large amounts of left-over war ma terial that were still in the land had depressing effect on trade in these par ticular lines. There are, for instance great piles of wool, and immense store of wheat, as well as considerable heav machinery."

The labor situation, he thought, a though far from what it should be, wa improving. Many employees were offer ing to accept lower wages and other were more inclined to listen to reason able arguments of manufacturers as t the vital necessity of reducing costs i order to compete in the world's markets "I have great faith in the triumph o moderate opinion in the Old Land," sai Mr. Field. "This year will probably b another one of readjustment but cond

*Canadian Agents:*

Williams & Wilson, Ltd., Montreal. The A. R. Williams Machinery Co., Ltd., Toronto, St. John, N.B., Halifax, N.S.

tions are gradually improving and we may expect to see John Bull take a much more intimate interest in the Canadian market.

The coal strike, he admitted, would probably set things back for at least another three months.

"I visited the principal industrial centres overseas and my outstanding impression is that the United Kingdom is again approaching a strong position for the conduct of export trade. Machinery and equipment are modern, office and works systems are satisfactory, and there is a keen desire to extend overseas trade. Given better conditions in the supply of raw materials and steadier labor conditions, the United Kingdom will, I believe, again assume in the world's markets its important role of the past.

"The present business depression is apparently helping to bring the readjustment which is necessary for the revival of trade. During this period, employers and labor appear to be making efforts to ensure that fair wages shall be paid and the proper output obtained.

The poor habit that some Canadian firms had formed during recent months of cancelling orders without any good reason other than that they desired to escape a falling market had left a bad impression at certain places in England. Mr. Field told of one firm that had dyed a $60,000 order especially for a Canadian customer, and the whole thing was cancelled when it was boxed for shipping. It was a dead loss, and the Canadian customer had refused to make any settlement.

## HOW STRIKES GO ACROSS THE LINE

**Reports of Various Wage Disputes and the Nature of Their Settlement**

New York.—The opposition of union molders employed in machinery foundries to the wage reductions that have been announced since the opening of the year has been disintegrating rapidly since the acceptance by the International Molders' Union of a 15 per cent. reduction of wages in stove foundries. It has been estimated recently that 60 per cent. of the members of the union have been out of work, and a considerable portion of the remaining 40 per cent. have been working part time. On April 1, molders' strikes were in progress in one or more shops in 109 cities. Among the settlements already made, some of which antedated the settlement between the molders and the stove founders, are the following:

On April 5 the union foundries in Pittsburgh gave notice of a readjustment of wages and the local union arranged for a reduction from $7.50 to $6.75 for eight hours. It was provided that this should be effective for 90 days from April 1.

At Detroit a reduction from $8.50 to $7.20 for eight hours was put in effect April 11, and was accepted by the union. On April 1 a large union foundry in Detroit which had been shut down for some time offered a wage rate of 85c per hour and this was accepted by the employees.

A reduction from 90c to 80c per hour was put in effect by the union foundries of Ansonia and Derby, Conn., on April 18, and was accepted by the molders' union.

Union molders at Baltimore who have been on strike against a reduction from $8 to $7 for eight hours have called off the strike and are seeking employment on the $7 basis. A number of foundries there, however, expect to maintain the open shop and are only employing men as individuals without any agreement with the union.

# The Week's Events in Montreal Industry

Thos. McMillan, first vice-president of the Canadian Fairbanks-Morse Company, was in Chicago last week attending the funeral of Charles Hosmer Morse, late president of the Fairbanks, Morse Company.

* * *

O. H. Willison, of the Lyman Tube and Supply Company, Montreal, has just returned from a six weeks' trip to England, where he spent a month at the plant of the Hoffmann Manufacturing Company, the largest manufacturers of ball and roller bearings in the British Empire. The Lyman Tube and Supply Company were representatives of this firm prior to the war, but for the past five or six years it has been impossible to obtain shipments from England. The Hoffman bearings are made in a large variety of styles and sizes to meet every industrial requirement. The radial ball bearings are made in both the "gap" and the "no gap" type. The Lyman Tube and Supply Company will carry a large stock of Hoffman equipment in their various Canadian warehouses.

* * *

The launch of the Norwegian cargo vessel "Topdalsfjord" from the yard of the Canadian Vickers last Thursday marks the cessation of operations at this plant for some time, at least in the nature of new work. Repairs to vessels afloat will be continued throughout the season, but unless new contracts are received the construction of new vessels will cease. There is a slight possibility that this company may be the successful tenderers for the ice-breaker that the government proposes building this year, but no definite announcement regarding this has yet been made. This last launching was attended by the members of the Federal Parliament in a body, and on the occasion of their visit to Montreal they were given a trip around the harbor as guests of the Harbor Commissioners, during which the new steel sheds of the Commissioners were officially opened.

* * *

C. E. Simon, of London, England, sales manager for the Swedish Machine Tool Makers Export Company, Limited, Stockholm, Sweden, has recently arrived in Canada for the purpose of studying industrial conditions and the advisability of establishing agencies in Canada and the United States for the different Swedish and English firms he represents. After spending a week or so in Montreal and Toronto Mr. Simon will visit the principal machine tool centers in the United States with the same object in view. It is possible that arrangements may be made for the manufacture of some of the lines in Canada or the States. The fundamental plan of the Swedish Machine Tool Makers Export Company is to facilitate the development of the specialties of each work. For this purpose a number of Swedish manufacturers made up an agreement between themselves regarding the machine types to be built and to unify the separate sales organizations in a joint sales office. The Export Company is no reseller, but an integral part of the different firms represented. The organization will handle the product of the following firms: Swenska Maskinverken, manufacturers of engine and screw cutting lathes, capstan and hexagon turret lathes, automatic machines, cutting off machines, milling and gear hobbing machines and drill presses; Kopings Mek. Verkstad, builders of engine gap, and face plate lathes, centering machines, hand and power milling machines (plain and universal), horizontal boring machines, sensitive and column drilling machines, open side planing machines, cutter and tool grinders; Munktells Mek. Verkstad, manufacturers of lathes, power presses, forging and drawing presses, screw presses, belt driven drop and pneumatic hammers; Lidkopings Mek. Verkstad, makers of lathes, boring mills, drill presses, planers and grinding machines; Atlas Diesel, manufacturers of vertical boring and turning machines, vertical milling machines and steam hammers. In addition to the Swedish lines here mentioned, Mr. Simon will represent the English firm of Thos. Ryder and Sons, Limited, of Bolton, manufacturers of multiple forging hammers; special machine tools for making piston rings and crankshafts for automobile, gas and oil engines, and shaker cranks for agricultural machinery, and high speed all-geared engine lathes.

## TURRET LATHE PRACTICE

"Turret Lathe Practice," by Joseph G. Horner, is the title of a recent book published by Emmott & Co., Ltd., 65 King street, Manchester, England. The English price of this book is 12s. 6d., and following are the chapters embodied in the book:

Chapter 1 is devoted to cycle of operations, tools, bar lathes, lathes for chuck work, and economy of turret work. Chapter 2 discusses such operations as centering, facing, pointing, box tools, steadies, hollow mills, solid and adjustable box tools, roller steadies, examples of taper turning, tools and appliances, and swing tools.

Chapter 3 takes up the selection of drills, methods of holding, holders and chucks, forms of drills, oil grooves, and flat drills. Chapter 4 discusses reaming, the causes of variations in size, floating reamer holders, use of pilots, clearances, grinding, expanding reamers, etc. Chapter 5 shows sample boring tools, boring bars, boring heads, and examples of work performed, this including taper work.

Chapter 6 covers the subject of screw cutting, methods employed, types of holders and die heads, taper threading dies, examples of work, etc. The next chapter shows varieties of cross slides and work accomplished on the cross slide, such as knurling, profiling, forming, necking and so on. Chapter 8 illustrates examples of tool equipment, while the next section is devoted to the capstan and turret details.

Chapter 10 covers the design of headstocks, going into adjustments of certain portions. The last chapter discusses collet chucks and wire feeds, this covering the functions and operations of such chucks, the use of false jaws, the air-operated collet, work held by interior , special designed jaws, roller feeds, geared feeds, etc., etc.

This book is carefully written, well illustrated by line drawings, showing considerable detail in the construction of the various parts, and should prove of value to those interested in turret lathe work.

---

# Trade Gossip

**Rail Order.**—The Algoma Steel Corporation has received an order from the Dominion Government for 50,000 tons of rails for the Canadian National Railways. It will require about two months to complete the work and the plant at Sault Ste. Marie is in full operation on the contract. Two thousand men are at work.

**A Big Undertaking.**—Charles Evans Fowler, engineer in charge of the proposed international bridge connecting Windsor and Detroit, stated that he is now preparing to award contracts, and he expects actual work will begin within six months. Operations will be started on Detroit side first. The Windsor terminal will be located at the extreme easterly end of the town of Sandwich. The construction, which is expected to take six years to build, and an amount of money bordering on fifty million dollars, will be of cable suspension type with a single span 1,800 feet long stretching from shore to shore, with a clearance of 110 feet for vessels.

**Secure United States Work.**—In competition with eight other elevator companies, the Fegles Construction Co., the only Canadian firm tendering, received the contract for the construction of an eighteen hundred thousand bushel elevator in Brooklyn, N.Y. The elevator will be known as the Barge Canal Terminals at Gowanus Bay, Borough of Brooklyn, the contract being $1,500,000. The terminals are to consist of fifty-four concrete tanks, a boiler house and power house, together with installation of machinery, the whole to be completed in every detail and ready for occupation by September 1, 1922.

**That Wage Cut.**—With reference to the 20 per cent. wage cut by the United States Steel Corporation, Ben I. Davis, journal manager of the union, stated that the wages of the men were based entirely on the selling price of products Several wage reductions, the manager said, have been experienced during the past six months by reason of a falling market and the consequent decline in the selling price of iron, steel and sheet metal goods. He spoke of how steel puddlers a few months ago received $18 per ton, whereas recent wage cuts had reduced that figure to $13.67 per ton This is the first time since 1904 that the wages have been cut and the second time in its history.

**Build in Canada.**—The English Electric Co. has announced its intention of extending operations to Canada, and it is understood that they will erect factories in Toronto for the manufacture of electrical machinery and equipment The company, which is said to be the largest firm of its kind in the British Empire, and one of the most powerful industrial enterprises in the world, includes among its directorate Sir John Mansell, Lord Meston and representatives of John Brown & Co., Cammell Laird & Co., Thomas Firth & Sons, and Harland and Wolff. M. Gordon F. Perry president of the National Iron Corporation, Toronto, has been appointed chairman of the Canadian board.

---

The Anglin-Norcross, Ltd., of Montreal, have received the contract for the construction of the live stock arena at the Exhibition Grounds, Toronto. The firm's tender was for $892,000, which was the lowest tender received. The building must be finished by November 1, 1921.

### NEW CATALOGUES

Those interested in any of the catalogues described below can procure a copy of the same by writing direct to these firms. Mention that you noticed this in Canadian Machinery.

### BOOK ON CONCRETE

The Truscon Laboratories, Detroit, Michigan, have issued a technical booklet, to be known as their pamphlet No. 8. In this booklet is a discussion of why concrete requires waterproofing, and the properties that an integral waterproofing must possess to operate effectively with the natural properties of concrete. To anyone handling concrete this book should be of interest.

### NEW BULLETIN

The Wayne Oil Tank and Pump Co., Fort Wayne, Indiana, have issued their bulletin No. 2500, which contains some very interesting information regarding the burning of fuel oil and the equipment necessary to burn various oils. The advantages of fuel oil are given, also comparative costs with other fuels. Labor costs are also stated, and a general summary completes the first portion of the bulletin.

From then on the oil burning system, its installation, equipment necessary, etc., etc., are given, a table being included showing the types of furnaces used for various kinds of work. Numerous other tables are also given, and the bulletin should be of special interest to manufacturers in general.

### METAL STATISTICS

The American Metal Market and Daily Iron and Steel Report, 81 Fulton St., New York, have placed on the market their 1921 edition of Metal Statistics, one of the handiest records of market tendencies and prices that could be secured. The information is put together in the form of tables that are easily followed. The book is generally accepted as the standard for market references. It is a valuable help to one who has cause to refer frequently to prices current in any line of iron, steel, or non-ferrous metals.

### SAFETY PANELS AND CABINETS

The Crouse Hinds Co., of Canada, Ltd., Toronto, have a bulletin No. 1D. which covers their line of safety panels and cabinets. This takes up the general specifications, the steel trims, and various types of safety panels. To those interested this booklet should prove of service.

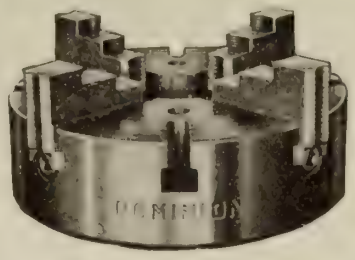
### RADIAL DRILL CATALOGUE

The Western Machine Tool Works, Holland, Mich., have issued their catalogue No. 21 dealing with their line of low hung drive plain and universal radial drills. This book includes both the plain and full universal type of drills, and the various units going to make up these machines are discussed in detail. Specifications on all machines are included.

### OIL ENGINE CATALOGUE

The Ker & Goodwin Machinery Co., Brantford, Ont., have issued a booklet on their Hvid type of oil engines. A detailed description of these engines is given, also instructions on how they are operated. Instructions for adjusting the engine are also given, in fact the book is a regular operator's guide as well as a general bulletin on the engine itself.

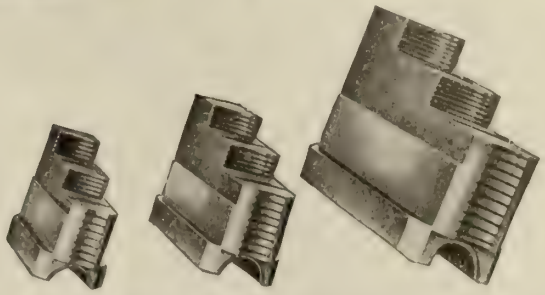
### WRENCH BOOK



J. H. Williams & Co., Brooklyn, have issued a booklet taken in part from their seventeenth catalogue edition. This booklet covers various styles of wrenches for engineers, textile workers, and machinists in general. Socket wrenches, "S" wrenches, and pin and face spanners are included. Various complete wrench sets are also shown.

### TRANSACTIONS AND YEAR BOOK

The University of Toronto Engineering Society have again issued their transactions and year book. This is the first publication of the society since the last issue of applied science in 1916, and the volume now issued contains many items of interest. Various papers in all branches of engineering are reproduced, and the latter portion of the book deals with University matters.



### BOOK ON COUNTING MACHINES

The Root Co., Bristol, Conn., have compiled and issued a book called "The Census Takers of Industry." It covers various suggestions and illustrates the versatility of automatic counting machines, showing how they remove the human element from counting operations.

1—12" x 8' "LeBlond" Tool Room (used).
1—12" x 6' Worcester, Q.C.G. (used).
1—8" "Rivett" with Cabinet, several attachments, (used).
1—7" Cataract Precision, several attachments (used).

### GAP LATHES

1—38" x 54" x 12' Bertram (used).
1—22" x 40" x 16' McDougall (used).
1—21" x 30" x 7' South Bend.
1—20" x 38" x 12' C.M.C. (used).

### TURRET LATHES

No. 4 Millhollands, capacity 1⅝" (used). Several Davis and other makes. Various capacities.

### SHAPERS

1—16" "MacKenzie" B.G. Crank Shaper, (new).
1—16" "Rae" B.G. Crank Shaper (slightly used).
1—24" "McGregor-Gurley" B.G. Crank Shaper (used).

### PLANERS

1—42" x 42" x 20' Putnam, 1 head (used).
1—30" x 30" x 10' Pond, 1 head (used).
1—24" x 24" x 6' Powell, 1 head (new).

### MILLING MACHINES

1—Briggs High Duty, Type "A," 22" Traverse (new).
1—Briggs High Duty, Type "B," 42" Traverse (new).
1—Whitney Hand Miller, 18" x 6" table (used).
1—No. 3 Ford-Smith Plain (used).
1—No. 3 Ford-Smith Universal (used).
1—No. 4 Cincinnati Plain (used).

### DRILLS

1—10" Burke Sensitive (Bench type) (new)
1—16" No. 2B Edlund H.S. Sensitive (new)
20" "Sibley," "Champions," "Rockwell" and "Silver" (new) and (used).
1—36" C.M.C. Heavy Duty (used).
1—3-spindle 20" Silver Gang Drill (used).
3—4-spindle W. & R. Sensitive (cap. ½") (used).

### BORING MACHINES

1—66" Bement-Niles Vertical, 2 heads, 24" under rail (used).
1—Universal No. 2½ Horizontal Table, 42" x 22" (used).
1—Bullard "New Era" Vertical Turret, 36", complete equipment (new).

### POWER HACK SAWS

1—No. 10 Racine 8" x 8" Cap. (new).
1—No. 7 Watkins 9" Cap., 18" Blade (used).
1—No. 1, 6" x 6" Racine (used).
1—No. 3 Robertson 6" x 6" (used).

### AIR COMPRESSORS

1—8" x 8" Sullivan, Class W.G.-3, Belt driven (used).
1—8 x 10 x 8 Bury, Steam driven (used).
1—12" x 18" Ingersoll-Sargent, belt drive (used).
1—12" x 12" Can. Ingersoll Rand NE-1 (used).

### GRINDING MACHINES

1—Landis No. 4 Universal (used).
1—Landis Plain, self-contained, 36" x 12" (used).
1—Fitchburg Cylindrical, 8" x 36" (new).
Several Tool and Cutter Grinders (new) and (used). "Globe," "Stevens," "LeBlond" and "Cincinnati."

### MISCELLANEOUS

2—No. 4 Jno. Hall Pipe Machines (1 used) (1 new).
1—Lennox Rotary Bevel Shear, 1" Cap. (new).
1—"High Speed" Riveting Hammer, No. 3A (used).
1—Beaudry Champion Power Hammer, No. 9 (used).
1—"Grant" Rivet Spinning Machine, No. 80A, (new).
1—"Grant" Rivet Spinning Machine, No. 80B, (used).
1—Arbor Press, No. 4 "Greenerd" (new).

PATENTED SAFETY SET SCREWS

SET A NEW STANDARD

The distinctive dove-tail slots or flutes of the "Bristo" safety set screw are one of the features which put "Bristo" in a class by itself. "Mushrooming," for instance, is impossible, and splitting or cracking have been removed from the list of your manufacturing worries. As the wrench turns, the unique "Bristo" design contracts the screw; on releasing the pressure the screw tends to expand—a tremendous gripping factor.

Quantity Production of Shafts in Automatic Heat Treatment Furnace.

## PRODUCTION MANAGERS

**The following advantages are secured by the Continuous Method of Heat-Treatment :**

Increased production per unit of floor space.
Reduction in manual labor per unit of production.
Uniformity of product, resulting in decreased scrap, following less dependence upon the human element.
The fuel economy that naturally follows the direct transfer of heat in spent gases to incoming material.
Improvement in working conditions by cooler shop.

**In short, the saving in cost of the finished product due to economy in labor, time, fuel, floor space, decreased rejections, etc.**
**Do these advantages appeal to YOU?**

*Write nearest branch for Bulletin 217-T and learn whether this method is adaptable to your product and manufacturing conditions.*

# Do You Read These Advertisements?

Every advertisement in this magazine is worth reading. It is the product of some concern that is using a modern method of making sales, viz., technical paper advertising, in order to present most effectively to you the leading features of its line.

These advertisers are making it easier for you to buy intelligently with the least waste of your time and theirs. They realize that a sales force cannot replace this service at equal cost. They know that advertising is good business, for the manufacturer who does not advertise cannot save the cost of advertising. Consistent advertisers are progressive merchandisers. They are saving your money and their own; and it pays to do business with them.

Don't miss your opportunities. These advertisements are interesting. Many are distinctly instructive, and a glance through them every month will keep you posted on the latest developments for machinery equipment.

THANKS—

To Mr. Wm. H. Keller—a line of Pneumatic Tools has been especially designed and built for your particular industry. Get our proposition on KELLER-MASTER:

# ROCKFORD

## —the best for varied work

General manufacturing plants prefer the **Rockford Miller** because they require a machine which they can depend on to do any work within its range to the complete satisfaction of the inspection department.

**Simplicity of operation** and **absolute rigidity under every condition** are distinctively **Rockford** features. They have made this the very best machine for general manufacturing.

## DIRECTORY OF DEALERS

THE Buyers' Directory of CANADIAN MACHINERY was originally intended to contain information regarding lines actually manufactured by our advertisers. We now carry the advertising of leading machinery dealers, some of whom represent scores of manufacturers in addition to being manufacturers themselves in some cases. This necessarily widened the scope of our Directory, but it would be impracticable to list all the lines handled by all the dealers. We recommend, therefore, if our subscribers cannot find what they want in our Directory that they communicate with the dealers whose names appear herewith.

LANDIS

# No. 4A Special Grinding Machine

## For Shops That Do Repairing

This Landis grinding machine has been especially designed for economically performing every operation necessary to put a gasoline motor in first-class condition.

**PISTONS, PISTON PINS, PISTON RINGS, VALVES, VALVE STEMS, PUSH RODS, CRANK SHAFTS, TRANSMISSION GEARS, KNIGHT SLIDE VALVES, PISTON VALVES.**

One of these grinding machines in your shop can regrind any part of the engine necessary—assuring yourself of continuous profits.

**Send for full particulars immediately.**

# *And Now—*
# Toronto Printers May Strike

THE present agreement between printers in book and job offices and employers in Toronto expires May 31. The minimum wage paid is $35.20 per week (increased voluntarily a year ago by the employers from $32.00, although the agreement had a year then to run). This wage covers a 48-hour week.

The International Union is demanding a week of 44 hours as the basis for all wage scales, and the Toronto unions are demanding a wage of $44.00 per week of 44 hours, $8.80 more per week for 4 hours less work.

This means an increase of from 73 cents per hour to $1.00 per hour, or over 36%.

Publishers and other employing printers feel that under present conditions of business and the admitted decreasing cost of living, the increased wages and shorter hours demanded by the International Union are unreasonable.

This is acknowledged by many of the thoughtful and loyal printers employed in the Toronto offices, who believe that the International Union has blundered in its demand that local unions shall not sign new agreements except on the basis of the 44-hour week.

The position, however, may be that these local men may not be able to make the International officers in Indianapolis see, that to force a strike now on these unreasonable demands would be an act of folly—and a strike may be called on June 1st.

The facts of the case are presented here, for the information of the sections of the public—subscriber and advertiser—reached by this publication.

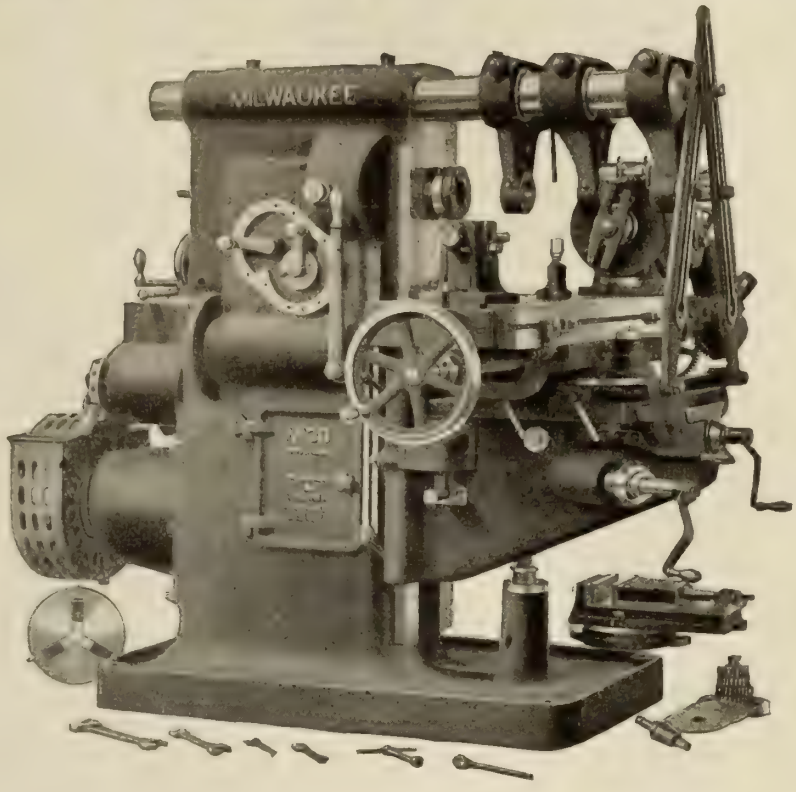
The attitude of the employing printers is shown by their voluntary action in giving a 10 per cent. increase last year while the agreement calling for the minimum wage of $32.00 a week had still a year to run.

They feel strongly now, however, that this is not a time when an increase of 36 per cent. in the labor cost of production should be permitted.

If publishers are forced to pay $44.00 a week instead of $35.20 and get only 44 hours of work instead of 48, it is inevitable that subscription and advertising rates must advance. No business can stand an increase in its wage bill of 36 per cent. and absorb that increase. The extra cost will have to be added to the sale price of the product.

Publishers sincerely hope that the great body of sane opinion among the local printers may prevail and that the Indianapolis officials will be induced to withdraw their unreasonable demands so that Toronto printers may continue to find well-paid, congenial employment.

If this sane, thoughtful opinion does not prevail, a strike seems inevitable, with its equally inevitable result of loss to the printers and publishers, and inconvenience and loss to the public.



An expression of the opinion of readers of this paper on the Union's proposals, involving an increase of 36% in the labor cost of printed matter, is asked. Will you not write a letter to the editor (not for publication) telling him your view of the situation?

*This statement is published by and has received the endorsation of the Toronto publishers who are members of the*

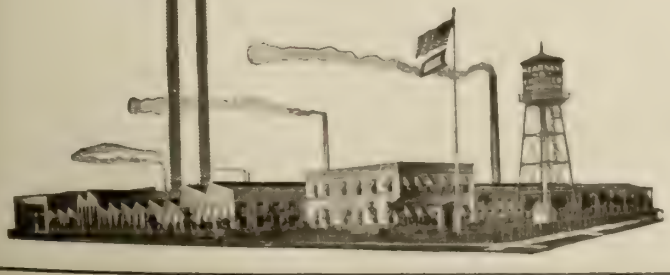
# MILWAUKEE MILLING MACHINES



## Superior Service in the Tool-Room

MILWAUKEE Universal Milling Machines are accurate, rigid and flexible and are distinguished for their efficiency on all kinds of milling done in the tool-room. Light or heavy operations are as one to the "Milwaukee."

A really scientific construction with all parts of the machine properly proportioned so as to form practically a single unit; features to reduce supervision, maximize ease of operation and increase the accuracy, rigidity and entire efficiency of the machines, make Milwaukee Universal Milling Machines the choice for the tool-room.

Firms that seek the certainty of tool-room milling satisfaction, find their hopes realized in the "Milwaukee."

## *faith, courage and industry*

have carried Canada through many crucial periods of history. These Anglo-Saxon qualities should be uppermost to-day. They are needed to revive Canadian industry. To avoid a crisis more smoke must issue from Canadian chimneys; more wheels must turn, and the wage-earner now out of work must be employed.

Those orders you are permitting to "hang fire" should be placed now. There is nothing to be gained by holding off for better conditions. Don't wait for the other fellow to act. If everybody waits there will be business for nobody.

Let your faith in Canada give you courage to stimulate Canadian industry by placing every pending order for commodities with some responsible Canadian firm—NOW!

You owe it to Canada, to Canadian industry and to yourself to take immediate action.

# Pratt & Whitney Taps

**"With the 'Con-eccentric' Land"**

P & W Taps are **good** taps—easily the best where accuracy and high speed are essential. They cost more to buy, but less to use than others.

If you're doing work that calls for big production and for unusual precision, give them a trial. You'll be back for more when you see them prove themselves.

The "con-eccentric" land — the special feature of Pratt & Whitney Taps, permits sharpening on face of the cutting edge without affecting size. It lengthens life and assures accuracy hitherto thought impossible in a commercial tool.

# To Decrease Operating Costs

The side carriage is an important part of the W. & S. turret lathe. It reduces operating costs, often by as much as one-half. It operates simultaneously with the turret and independently of it. The side carriage has a separate feed rod.

Take some of the simplest bar jobs; by cutting off with the side carriage while the turret tools are finishing their work, you save most of the cutting off time.

Here is the picture of a W. & S. 2-A. in a railroad shop. This machine makes bolts, pins, oil cups, valve parts, piston rods, and many other parts used in the repair of locomotives and cars.

On all these parts both turrets operate together.

Take this feature and the fact that the machine operates easily and accurately, and you know why the machine is popular with the shop men. It delivers the goods.

Send us blue prints of your parts and we'll tell you how long it will take to do your work the W. & S. Way.

# Why Not Do It With Air?

***A Message of Interest to the Small Shop Owner***

**"Imperial 14's," one of the many styles of Canadian Ingersoll-Rand Compressors, are made in a wide range of sizes for Stationary and Portable Service and for Gasoline, Electric or Belt Drive. Bulletins 3039 Stationary Type or 3215 Portable Type sent on request.**

There are a hundred and one places around your shop where compressed air will cut down time and expense.

Take painting for instance. The air brush will do a quicker and a far better job—and one man can handle it.

And cleaning—how much time do you lose brushing off the top of machine tools, cleaning motors and brushing in the little corners behind a stack of material? This can all be done with the air jet and the job is finished before you know it.

There is no longer any doubt about the saving made by portable pneumatic hoists, riveting and chipping hammers, drills, and wood borers. This has been definitely proven in the large automobile factories and you can benefit by their knowledge and experience. These portable pneumatic tools can be taken to the work and both the odd jobs and the steady work become paying propositions.

In our extensive line of air machinery you will find Compressors, Hoists, Blow Guns and "Little David" Pneumatic Tools. We will gladly send you bulletins describing these machines.

# *AN OUNCE OF PREVENTION*

Evans' "Almetl" — The Reliable, Enduring Firedoor

EVANS' "ALMETL" Fire Doors are the "ounce of prevention" against the spreading of fire in factory, warehouse, mill or commercial building. Wherever there is a door, it should be an "ALMETL." Stoutly built of heavy corrugated steel, galvanized, and interlined with asbestos roll board, they make an impassable barrier to the most intense fire.

The frame of the "ALMETL" is 3-16" x 2½" Bar Steel, reinforced on all edges by an extra heavy binder of galvanized steel which forms a box for the panel and prevents damage to the door by trucks, etc.

Approved by the underwriters.

Write us for descriptive literature, specifications and prices.

# THE JOHNSON FRICTION CLUTCH

## The Case Against the Countershaft

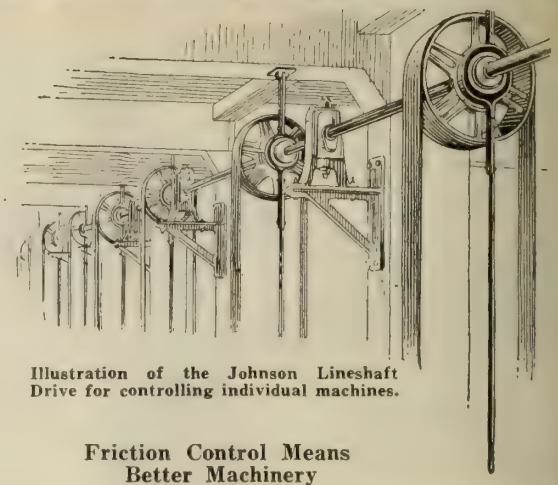
The old familiar countershaft drive, through cross belts and tight and loose pulleys, stands accused of the following offences against efficiency:

1. Involves needless equipment.
2. Costs too much to set up.
3. Prevents economical and systematic use of space.
4. Operates sluggishly.
5. Multiplies belt troubles and the resultant cost of upkeep.

Modern practice has discarded the antiquated countershaft for the simplicity and efficiency of the clutch drive direct from lineshaft..

**Adopt the Johnson Lineshaft Drive**

The economical, efficient and durable method of power transmission through friction control.



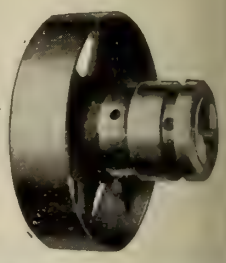


Illustration of the Johnson Lineshaft Drive for controlling individual machines.

**Friction Control Means Better Machinery**

Whether it is applied overhead or in the machine itself.

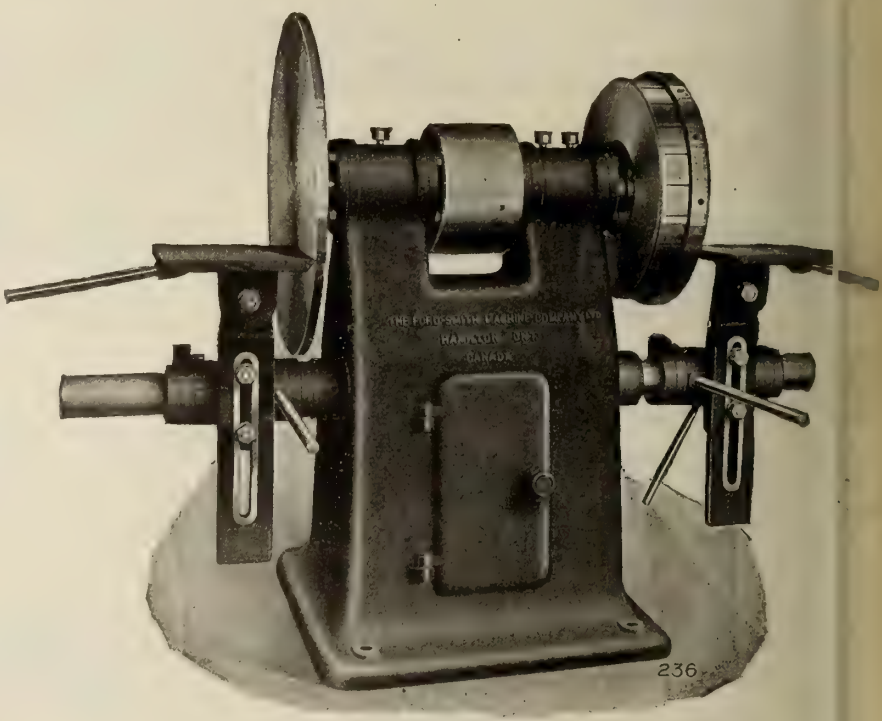
New Design No. 4 Plain Miller

# FORD-SMITH



## Milling Machines and Disc Grinders

Ford-Smith Milling Machines are correct in design, built to last and insure rapid, quality production. Look in any of the best shops. You'll find Ford-Smith Millers boosting production.

Ford-Smith Disc Grinders are an efficient link in lowering production costs. These dependable machines are almost indispensable for handling work that calls for machines of strength, accuracy and durability.

THERE is one thing you expect from every Miller or Disc Grinder purchased. That is **satisfaction.** You can get no more, for satisfaction is an incorporation of every desirable quality—accuracy, speed, dependability—everything that goes to make a profitable investment.

In buying Milling Machines or Disc Grinders bearing the Ford-Smith trademark you are assured of perfect satisfaction. Every Ford-Smith Machine is subjected to the most exacting tests before leaving the factory and is guaranteed to give the best of service. That's why there are so many in use.

# A Quick and Easy Means of Tapping Square or Hexagon Nuts

MODERN manufacture and industrial readjustments demand a machine tool, which, besides being a high-speed producer, is capable of precision work under the most severe service.

Of such nature are Acme Nut-Tapping Machines. These easily-operated tools are limited to speed only by the endurance of the taps. For this reason Acme Machines most profitably meet to-day's demands.

One plant has been using two Acme Tappers for eight years. They have subjected them to the most strenuous service, yet to-day each averages 10,000 threaded nuts per nine hour day with a spindle speed of 100 r.p.m., the limit of tap endurance on the tough material used.

This concrete example of Acme performance is being emulated in hundreds of other shops.

If you want, then, a convenient tool, a fast and accurate tool, a tool that will stand up indefinitely—look for the name "Acme."

In every respect Acme ability clearly reflects the years of building experience.

**Write for illustrated catalogue of Bolt, Nut, Rivet, Upsetting and Forging Machinery.**

# ACME Nut Tapping Machines

Acme Six-Spindle, Semi-Automatic Nut Tappers have many important features which facilitate operation and increase speed. Each spindle is equipped with automatic lifting device which permits automatic feed to place nut under tap. Every action has been carefully developed and proved correct in practice. Write for further details.

## The Acme Machinery Company

# ROYLITE CLEANER

## Promotes Economy in Toronto Plant

ROYLITE cleans steel quicker, with less expense, and in every way gives better satisfaction than any other cleaner ever used. This is the experience of the Chapman Double Ball-Bearing Co., Limited, Toronto.

The illustration shown here is drawn from an actual photograph taken in the Chapman plant. The man in the picture is dipping Ford Front Wheel Axle Bearings in a vat of Roylite Cleaner. About 140 bearings are placed in each tray and then submerged in the boiling solution for three seconds only. When removed the bearings are thoroughly clean — the dirt and oil collected during assembling operations are entirely removed.

ONE OF THE CHIEF CHARACTERISTICS OF ROYLITE IS THAT IT PREVENTS RUST; it is the only cleaner yet tried out by this firm that gives entire satisfaction in this particular.

All exacting work of this nature is [illegible]ped in Roylite in the Chapman plant—distinctive proof of Roylite's efficiency.

*We will send an expert with sample to your plant to give a free demonstration on request.*

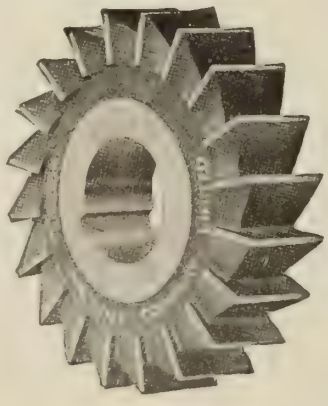
IMCO TOOLS



# The "Brain" Margin in Machine Tools

YES, Sir, it's the "brain" margin that makes or breaks a machine tool.

Why does one apparently good tool fail while another succeeds? Why does one speedily finds its way to the scrap heap while another is a "production booster?"

It's in the size of the "brain" margin; the knowing how that determines the extent of a tool's efficiency.

IMCO three and four lip drills, reamers, cutters, and mill ends are built by an organization which spent years in "finding out." IMCO Tools cut more metal in less time; last longer; are more accurate, because of the extra margin that comes from "knowing how."

**When you want a precision tool choose "Imco." Imco reamers are milled twice as deep as ordinary reamers.**

The most complete of modern machine shop facilities enables us to expertly handle any kind of machine tool or machine construction. Consult us on your engineering problems.

HEALD

# Heald Employees Enter Regrinding Business

Cylinder regrinding corner at Ramsdell & Van Dyke's, Worcester, Mass. Two years ago they started on practically nothing. Now, six men are required to take care of the blocks that arrive each day.

A man that practices what he preaches, or a doctor that will take his own medicine, is usually thoroughly convinced of its advantages and merits.

So enthusiastic are the Heald employees over the possibilities and profits of cylinder regrinding that many have gone into the business themselves.

Above is the regrinding corner at Ramsdell & Van Dyke's shop in Worcester, Mass. Van Dyke was formerly demonstrator for The Heald Machine Company and started in two years ago with Ramsdell, who also worked at Heald's. "We had blocks ahead of us from the very first," is the way Van Dyke defines his business that has grown by leaps and bounds in two years' time.

Just recently Oliver Johnson, demonstrator and salesman in the Chicago territory, has heard the call and gone into cylinder grinding.

These boys know the returns of shops equipped with Heald machines. They are getting into the game while the getting is good.

Since the first appearance of the self-contained Style No. 55 with its large capacity and wide range, its simplicity and moderate price, the whole Heald organization from the office boy to the general manager has been filled with enthusiasm over the possibilities of regrinding. Every employee is sold on the proposition.

**Let us give you facts and figures on the possibilities and profits of regrinding. Wire, phone or write.**

# Cutting Commercially Accurate Threads in Monel with GTD *"Gun"* Taps and *"Acorn"* Dies

NO ordinary tap or die can thread Monel metal—a fact which up to now has limited its use in many plants, where its great strength and non-corrosive properties would otherwise strongly recommend it.

The GTD staff, however, recently made a series of tests with Monel and to the great satisfaction of the officials of The International Nickel Company, who produce this popular metal, proved that it can be tapped and threaded to any degree of commercial accuracy required in spite of its toughness and ductility.

Instead of
—cutting over size —clogging
—breaking —dulling
the GTD *"Gun"* Taps did their work as cleanly and with as little difficulty as they would in steel, and when thread after thread had been cut with the chips shooting ahead, in true "Gun" Tap style, the threads were gaged—the first and last in each hole measuring to size without perceptible variation.

With samples of threaded Monel and a report of the tests before them, the International Nickel Company sent in this letter, which we are proud to quote:

> "We have received and examined samples of Monel Metal threaded and tapped with your *"Acorn"* Die and *"Gun"* Tap. The fact that there are no indications of torn surfaces or of split threads is evidence of the efficiency of your tools.
>
> "You are to be congratulated that so successful a piece of work could be done using your stock tools, and by operators unfamiliar with threading Monel Metal."

If you have a threading problem which involves Monel or any other metal, which has previously been difficult to thread, try the *"Gun"* Tap and *"Acorn"* Die—specially designed exclusive GTD products. Or if you wish the experimenting done for you, write us stating kind of metal used, or sending sample—and our engineering department will demonstrate quickly and thoroughly how the *"Gun"* Tap and *"Acorn"* Die work. We will be pleased to send you circulars descriptive of the *"Gun"* Tap and *"Acorn"* Die. Just fill out and mail the attached coupon.

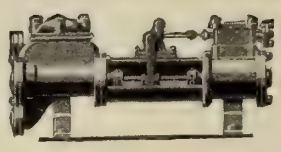
# Where failure of the smallest part may cause the greatest loss

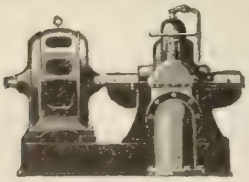
WHERE continuous service is necessary, but where acids, alkalies and steam tend to destroy, see that essential parts are made of Monel.

Where a part has failed due to a lack of strength, corrosion or rust—replace it with Monel.



Monel resists corrosive and erosive action, is as strong as steel and has practically steel's co-efficient of expansion. There are hundreds of places in your plant where Monel will save you money and uncertainty.

# Monel metal



**VALVES**—Use Monel for seats, rings, guide stems, clappers, wedges, spindles, dash pots and pistons. You are assured that none of the parts will fail under any conditions for which the valve was designed. Chapman, Crane, Jenkins, Lunkenheimer, Nelson, Walworth, Pratt & Cady and others use Monel in these parts. *Make it of Monel.*

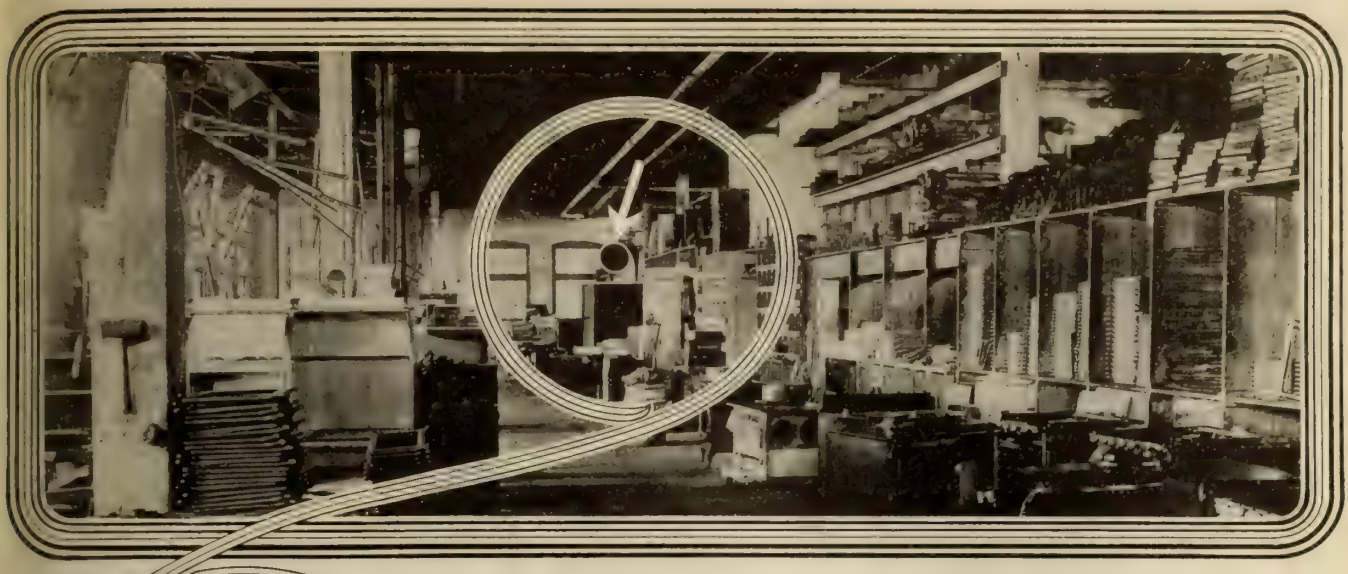
**PUMPS**—See that Monel is used for liners, runners, valve seats, trim, hand hole covers, plunger rods, stuffing boxes and plungers. Strong as steel, uncorrodible and proof against superheat, it makes any pump the ideal towards which its designer worked. *Make it of Monel.*

**TURBINES**—Monel blading and poppet valves are necessary for perfect turbine operation. At least the United States Navy thinks so. Monel is unaffected by high pressures and the eroding impact of superheated steam. *Make it of Monel.*

**BLOWERS**—If the blading of your blower is made of Monel, it will stand up under the corroding action of nearly all gases and dusts. Very few acids or alkalies affect Monel and it simply won't rust. *Make it of Monel.*

**GAS AND OIL ENGINES**—Specify Monel for valves, ignition chambers, ignition tubes, fuel filters and scavenger valves. It has practically the same co-efficient of expansion as iron and therefore can be readily combined in design. It is as strong as steel, never rusts and resists high heat and corrosion. *Make it of Monel.*

**METERS**—Monel cylinders, bushing, valves, valve parts, spindles, screws, gear and wheels, assure the accurate and continuous work demanded of these instruments. *Make it of Monel.*



The name Monel identifies the natural nickel alloy—67% nickel, 28% copper and 5% other metals—produced by The International Nickel Company. Monel products include Monel blocks, Monel rods, Monel castings, Monel sheet, Monel wire, Monel strip stock, etc.

# Why Heat Your Factory Only in Spots?

The Skinner Bros. (Baetz Patent) Heating System will heat all of the open space in your factory all of the time—there will be no places continually too warm while others are too cold, as is usually the case with old-time heating systems.

## Simple and Economical

Skinner Bros. (Baetz Patent) Heaters operate without outside pipes or ducts. They are portable and require no foundations—cost of installation is 15% to 50% less than any other system—operating cost is equally low. The mild, constant circulation of warm air does not cause drafts or air blasts, raise floor dust or create other conditions injurious to the health of employees.

### Mechanical Details

Built as an individual enclosed unit with a series of pipe coils compactly mounted above a powerful fan-wheel. Coils are heated by exhaust or live steam. Cold air is drawn into the heater by the fan, impelled upward and around the coils, and, after being heated, is diffused through outlet hoods to every part of the open area. No pipes or ducts used. The fan is operated by any power available.

### Direct-Fired Type

Where steam is not available, we supply our direct-fired type DF, which burns coal, coke or wood. Built on the same scientific principle as type SC. The fan is operated by any power available.

## Get Further Details

The principle of operation of Skinner Bros. (Baetz Patent) Heaters is briefly described at the left. Performance is guaranteed on a strictly money-refund basis. Complete detailed information and list of users will be sent on request. Please use the coupon.

# CHROME VANADIUM STEEL

for

*HEAVY DUTY* *MACHINE WORK*

Chrome Vanadium Steel in its various carbon ranges is one of the most widely adaptable of Alloy Steels, and possesses remarkable characteristics.

Its high tensile strength and elastic limit, together with its excellent dynamic quality (resistant to fatigue), workableness and susceptibility to heat treatment, make it an ideal steel for use in the construction of heavy duty machinery.

In Pistons—Forging Hammer Rods—Gas Engine Parts—Foundation Bolts—Gears—Shafts—

wherever strength, ductility, life and safety are essential, Chrome Vanadium Steel will fill the requirements.

Chrome Vanadium is only one of the many Alloy Steels which we have assisted in developing. We supply it rolled into bars, billets and slabs, and our Metallurgical and Engineering Departments co-operate with the users on its proper application and working.

# *Clothed in Robes of Authority*

A JUDGE is an authority on law. On the bench attired in his judicial robes and other accoutrements of his high office he is clothed in an atmosphere of authority—an authority that is held in high esteem.

Your advertisement in the pages of a **high-class** technical newspaper is like the judge on the bench. It, too, is clothed in robes of authority—robes of technical authority. It, too, is esteemed accordingly.

The **high-class** technical newspaper is edited by an authoritative staff of technical writers. Their views are read and accepted by proprietors, executives and buyers of machine, power plant and industrial equipment.

A technical advertisement in a **high-class** technical paper thus finds its natural environment—where it will be fully appreciated and assimilated.

Your guide to a **high-class** technical newspaper is found in the Canadian National Newspapers and Periodicals Association. Every member in this association is pledged to an editorial policy of unimpeachable character, in addition to a plain, proven statement of circulation.

It is a fact worthy of note that the "big four" of the technical field of Canada are members of the C.N.N. & P.A.:

**CANADIAN MACHINERY**
**POWER HOUSE**
**CANADIAN FOUNDRYMAN**
**MARINE ENGINEERING**

Complete information regarding this well-known group of technical papers may be obtained on application at the office of the Association, 70 Lombard St., Toronto. **You are invited to ask questions.**

***Eight Branch Offices***

*If interested tear out this page and place with letters to be answered.*

**Asphalt**—Asphalt is used for the first coating. Experiments have proved it the best protector of steel against corrosion.

**Asbestos**—Asbestos felt also completely covers the steel. It cannot rot or decay. Acids and alkalies do not affect it.

**Waterproofing**—The third coating is a weather resisting and chemically inert compound. It reinforces and multiplies the durability of the finished product.

# Permanently Replaced without Plant Interruption

Your roof can be both *permanently* and *quickly* replaced with Robertson Process Metal. It can be so easily accomplished that your plant operation need not be interrupted. You will have a more substantial roof and in addition to longer life you will have the advantage of greater insulation properties which will keep the building cooler in summer and warmer in winter.

Your present need for greater economy in maintenance and repair expense is fully met by this enduring Robertson Product. Nothing shows this quite so convincingly as the examination of a sample of Robertson Process Metal.

We have a process sample ready for immediate mailing. It will show you how the steel sheets are hermetically sealed and how both surfaces and edges are completely encased by the three impervious coatings (1) Asphalt (2) Asbestos (3) Waterproofing.

Robertson Process Metal is made in corrugated, flat and mansard sheets for roofing and siding. It is also built into trim, flashing, gutters, downspouts and ventilators. Send for the process sample today and let us send you detailed literature.

LANDIS

The Landis Boring, Milling and Drilling Machine accurately and speedily machines the heaviest castings. The usual expense of set-up time is "cut to the quick" by the use of the Universal Tilting and Rotary Table. With one set up of the work on this table, five sides or any angle of the piece can be bored, milled, drilled, tapped, etc., making a decided cut in non-productive time.

The Landis is a powerful tool and is highly adaptable to scores of operations. Its design, material and finish all show perfection in machine tool construction.

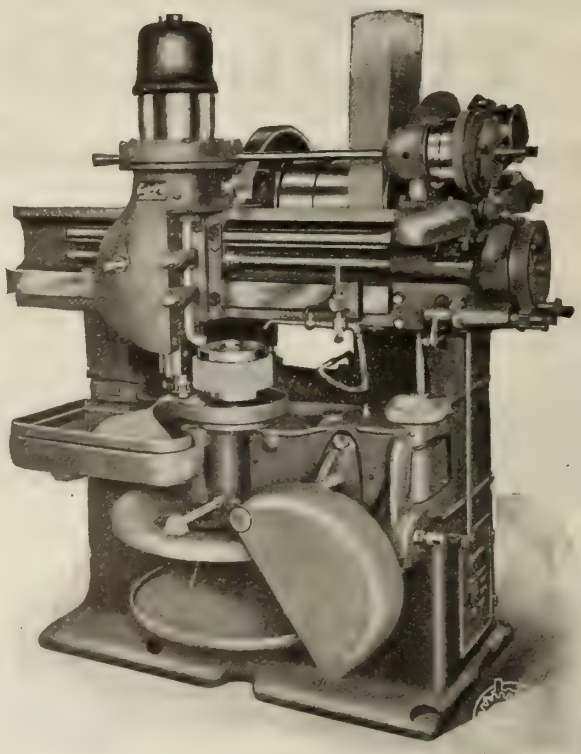
# Gear Cutting With the "IFS" Left Out

## The Gear Shaper Way



A production manufacturer knows that he will secure good gears IF he has an accurate cutter, an accurate machine and a machine working on the correct principle. The whole question of good gears is resolved in this one little word "IF."

When the Gear Shaper was originally designed, the question of "IF" was taken into consideration and every possible means known to mechanical engineering was employed to eliminate the "IFS" from gear cutting.

That we have been successful in solving the problem is evidenced by the fact that each ensuing year sees a larger number of manufacturers adopting the Gear Shaper method.

How the Gear Shaper has accomplished this is clearly explained in our general catalog "Commercial Gear Cutting," which is a treatise on the subject of:—
Gear Cutting with the "IFS" Left Out.

**Send for your copy to-day.**

The Fellows Gear Shaper—the machine which has taken the "IFS" out of gear cutting.

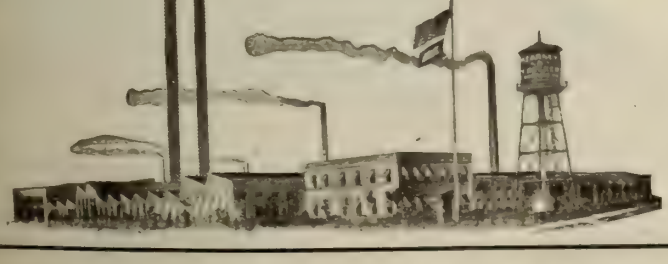
## EFFICIENT MILLING



THE rigidity and reserve power of Milwaukee Milling Machines permit high speeds and deep cuts without impairing the accuracy of the work.

These sturdy machines are quickly set up and easily operated. They are economical on light or heavy milling.

Constant speed drive, hardened steel gears and shafts, automatic flooded lubrication, double overarm, solid top, box-section knee with extended slide, flanged spindle, reverse self-contained, cutter lubricating pump that operates only when spindle revolves—these are the features that make Milwaukee Milling Machines profitable producers.

An Organization Can Best Be Judged by the Service of Its Merchandise

THE re-incorporation of the Smiths Falls Malleable Castings Limited, the second oldest malleable castings concern in Canada, has taken place. The knowledge gained by forty-three years' experience is represented in every casting we make. Starting in 1878 in a small way with a cupola and a one-ton annealing oven, a high standard of quality constantly maintained has built two plants covering the better part of two acres and having an annual capacity of 8,000 tons.

**Established 1878**

# BROWN & SHARPE
## Heavy Service
# Grinding Machines

## The Correct Speed and Feed for Any Diameter *Easily and Quickly* Obtained

### Why You Should

*Specify B&S Machines*

Brown & Sharpe Plain Grinding Machines on short jobs of making repair parts or on long manufacturing runs assure low production costs and high standards of accuracy. Staunchly constructed, these powerful machines allow rapid operation, while the handy arrangement of operating levers, hand wheels, etc., make quick set up possible.

Other features that instantly appeal to the shop man and equally as noteworthy as the one pictured here are—

An accurately and quickly adjustable automatic cross feed—Independent automatic cross feed for feeding wheel to work without traversing table — Universal back rests.

The wide range and complete separation of speeds and feeds on this machine provides a combination that will assure any desired result as to finish or rate of production, while the ease and quickness with which any speed and feed can be obtained, by simple and quick adjustments of work speed and table feed change levers as shown in small illustration below, saves valuable time and eliminates guesswork. Especially advantageous on short run jobs.

# HOEFER

## The complete drilling service

When we say Hoefer Drilling Service i **complete,** we **mean** it. Suppose, for example you are now drilling a number of holes in single piece and wish to reduce the drilling cost on the job. All you need do is to send Hoefer a postcard telling about it.

Hoefer studies your proposition from every angle, tells you definitely whether you present method can be improved upon and if so gives exact figures of the cost of new equipment and the saving it will effect for you. The decision is left entirely to you without argument. Then, if you consider the investment worth-while, Hoefer designs and builds **every portion** of the drilling equipment, with all necessary jigs and fixtures ready to run, and finally, guarantees results both as to quality and quantity.

That's why we say Hoefer Drilling Service is **complete.** There are no gaps for you to fill in. Are you interested? Just drop us the postcard and take advantage of the first phase of Hoefer Service. It places you under no obligation.

*Send for the Hoefer Catalog.*

CANADIAN MACHINERY
AND
MANUFACTURING NEWS

VOL. XXV. No. 21 May 26, 1921

# You Have Come Through the Worst of It

WE are passing through that period of readjustment that hurts. For a long time we turned that word over as something that was to come. It would affect every business house except our own and touch every income except our own.

For over two years after the war we went through a period of poisonous and alluring fallacy. We came almost to the point of believing that for the benefit of this particular day and generation history was not going to repeat itself.

Every man who had anything to say started with the solemn declaration that pre-war conditions would never be repeated—that we had arrived at a new stage where we had a few more dollars and each dollar was worth a little less.

It is all very well when you have a sick man to give him a jab of some stimulant to brace him up.

**It is the course of sanity to have the disease removed rather than the patient doped beyond the point where it is possible for him to permanently rally.**

Some months ago we had a much-advertised campaign showing that prices went up a step at a time and would not come down on the bannister. A gradual ease-off on prices may be quite desirable but it makes a long declining market, and a declining market is the best thing in the world to kill business.

Where is our Canadian courage that went through the crisis of 1914—that rallied to a buying movement in the face of a world war—that tackled, solved, and mastered the making of war munitions?

**It is time it showed itself again in placing business that has been hanging fire month after month.**

When any one section of the business community decides it is going to get out of the markets and stay out of the market, and that it will sell and not buy, it sets in motion a dangerous and undesirable movement that will come back upon that section just as surely as day will follow night.

There are too many men and there are too many firms in the country with the one object of seeing how much they can take out of the business world to-day.

They have not yet grasped the fact that if they keep on taking out more than they are putting in the world is going to be poorer by reason of their existence.

**If you can place business at the present time, it is your duty, as a citizen of this country, to do it.**

If you are not prepared to do your share in combating the sleeping sickness that seems to have seized the business community, you may be called upon to contribute more handsomely in an effort to rescue it from a more serious condition later on.

If you are still nursing memories of the time when you were making $12 a day in a shell shop, and when there were a dozen jobs to you all the time—forget it.

Remember there were hundreds of thousands standing in a trench in France at $1.10 per day at the same time.

**This country is better off than any country under the sun at this time. There are many firms doing 60 per cent. of their 1920 business.**

It is not fair to count the last part of 1919 and 1920 as normal years. They were abnormal. A more just comparison is with 1913 and 1914.

Weed out your wasteful habits. Spend a little less than you earn.

If you have weathered the storm this far you have gone through the worst.

# Business Conditions in the Canadian Centres

## Trade Has Been Rather Dull in All Centres—West Shows Substantial Industrial Expansion—U. S. Branches Continue to Look to Canadian Cities as Locations For Branch Factories

### AMERICAN FIRMS LOOKING FOR LOCATIONS IN CANADA

#### Hamilton Reports That Conditions Are Better Than In Early Part of the Year—Many Inquiries Are Being Made by U.S. Firms Regarding Locations

By C. W. KIRKPATRICK,
Industrial Commissioner, Hamilton.

HAMILTON—Although industrial and employment conditions are still far from being normal, there has unquestionably been a very noticeable improvement during the month of April and the early part of May, with better prospects that by the fall of the current year things will have reached a more normal level and conditions have become more satisfactory for both employer and employee.

During the past month there have also been unmistakable signs of considerable industrial development in the near, if not immediate future. Many American manufacturers are again turning their eyes towards Canada and are apparently not only gathering information by correspondence, but also making personal investigation to acquaint themselves with the Canadian market and its possibilities. Owing to the abnormal conditions that have existed since last fall, there has been less industrial expansion than usual this spring, but the local Industrial Department has been kept fairly busy supplying information to, and otherwise assisting prospective locators, and indications are that once they are satisfied that the period of depression or inactivity, through which nearly all countries have passed, is drawing to a close, there will be a rush of American capital and American industries to Canada and more especially to the province of Ontario.

While times have not been as good as during the two years following the close of the great war, locally, at least, there is little cause to worry about the future. Manufacturers, wholesalers and retailers have been busy for several months now readjusting their business methods to meet the changed conditions. This work is now either completed or nearing completion and there are good reasons for hoping and believing that before long business will be on a firmer foundation.

* * *

### CALGARY PASSING PERIOD OF READJUSTMENT WITHOUT TROUBLE

#### Government Guarantee of Irrigation Bonds is Likely to Have a Very Beneficial Effect And Provide Work—Building Shows Decided Increase

By J. H. HANNA,
Secretary Calgary Board of Trade.

CALGARY—Calgary is passing through the readjustment period without serious difficulty and while conditions are not, of course, as bright as we would like to see them, still there is no reason for pessimism.

There has been some unemployment this spring and there is still a surplus of labor. The recent decision of the Alberta government to guarantee irrigation bonds will result in work on the Lethbridge Northern Irrigation District project being undertaken at once, and tenders have been called for. As soon as this work is started it will, no doubt, give employment to a large number of men.

Crop conditions were probably never better in this part of Alberta than at the present time.

Considerable attention is being given to bonafide oil development and a number of wells are being drilled in southern Alberta and other parts of the province. Reliable men, who are familiar with the situation, are confident as to results in the near future.

So far as building construction is concerned, Calgary building permits for the first four months in the year show a total of $1,267,800 as compared with $809,000 for the first four months of last year, an increase of $458,800.

Several big conventions are coming to Calgary this year and American auto tourist travel from California, Oregon, Washington and other States to the Canadian Rockies via Calgary, together with the usual tourist travel by train, will bring large numbers of visitors during the next few months.

* * *

### WINNIPEG HAS LESS UNEMPLOYED THAN ANY OTHER CITY OF ITS SIZE

#### Bank Clearings Considered Very Satisfactory—General Prospects Are Very Bright And Building Operations are Being Carried Out at Good Rate

By W. E. MILNER,
Managing Secretary Winnipeg Board of Trade.

WINNIPEG—Winnipeg is in a very flourishing condition at the present time. The bank clearings which were published at April 30th, read as follows:

| | |
|---|---|
| Month of April, 1919 | $153,888,003 |
| Month of April, 1920 | 188,183,383 |
| Month of April, 1921 | 206,396,710 |

You will therefore see that our bank clearings for the month of April exceeded those of 1919 by $52,000,000 and surpassed 1920 by $18,000,000. Our bank clearings for the month of January, February, March and April, the first four months of the year 1921, amounted to $785,893,623, while in 1920 they amounted to $755,536,193, surpassing 1920 by $30,357,43 and 1920 was the banner year for bank clearings in the city of Winnipeg.

I am quite safe in saying that we have less unemployment than in any other city of a similar size on the North American continent. It is true that we have had a serious drop in the price of wheat, which has been somewhat disappointing to the farmers, but this is not a provincial or a local condition. This is a world-wide condition. Wheat dropped in Chicago, Minneapolis, Omaha, Kansas City and New York markets. These are the leading markets of the United States, and prices have declined to a much greater extent than they have in the Winnipeg market. Wheat has depreciated in value in Australia, England and the Argentine, and we must sooner or later conform to world values.

The prospects at the present time are very bright and the farmers of Western Canada are looking for a good full crop. The reports of the different provincial governments and the agricultural agent of the Canadian Pacific Railway and all the Federal departments of agriculture show most clearly that there has been more land prepared for seeding this year than last. There is no scarcity of seed. There is no demand from the farmers of Western Canada to provide them with seed to sow. Every farmer is well supplied. Labor is plentiful and climatic conditions were never better.

The movement of grain on the railways to the head of the lakes is greater by 1,850,000 tons than it was in 1920, and the C.P.R. and the C.N.R. never operated a season in Western Canada more successfully than the one that has just passed

There are several divisions along the railways where a snow plow has not appeared on their tracks this year. The equipment has been used to its fullest extent with the result as stated above, in the very greatly increased tonnage.

Our manufacturing establishments have not shut down, not a single one of them. There is more or less of a boom in building operations and there is every reason to believe that the building permits issued by the building inspector will be far in excess of last year.

We are free to admit that in the rural districts in Western Canada that business is not quite so good as it was in 1920, but we regard this as a good omen. It proves to the thoughtful mind that the farmer is economizing and saving to meet his obligations and to have sufficient means to carry on his agricultural operations for the next four months.

## RECOVERY OF TRADE HAS BEEN SLOW AROUND ST. JOHN, N.B.

### Believe There Must be Greater Co-operation on the Part of Labor Before Progress Can be Made —Some Factories are Increasing Working Hours

By R. E. ARMSTRONG,
Secretary St. John Board of Trade.

SAINT JOHN, N.B.—A survey of St. John business conditions at the present moment shows a feeling among business men that the anticipated upward leap of trade and production is still some distance away. This feeling may be traceable in large measure to strikes and other labor difficulties in Great Britain and the United States and to the general fear on the part of labor that their organizations are imperilled.

This condition is reducing the demand for lumber and other kinds of building material, although it has not wholly put construction work off the map. In St. John, for example, the pressing demand for more school buildings, for hospital expansion, water extension and street improvements, has led to the promotion of construction in these lines, but outside of public works of this character there is little in the way of private building going on. A great deal of repair work that was deferred during the war is being made and this in a way is helping out the general situation. But until labor reaches a better understanding and is prepared to extend more co-operative action, progress in construction and other lines is going to be slow.

Here and there is a rift in the cloud through which a ray of sunshine appears. For example, export demands have caused greater activity in the sugar refining business and the local refinery is now working full time.

One of the cotton mills that was operating on short time is extending its employment hours this week, but the second mill is still on short time. The outlook is reported to be improving.

The nail business is trying to get on its feet and is making some progress in that respect.

The sales tax increases as recently imposed have provoked some criticism, chiefly in the grocery line, but this will doubtless adjust itself later on. While the outlook is becoming a little brighter here and there and buying is on the increase, the general business situation is still depressed to a degree and calls for careful handling.

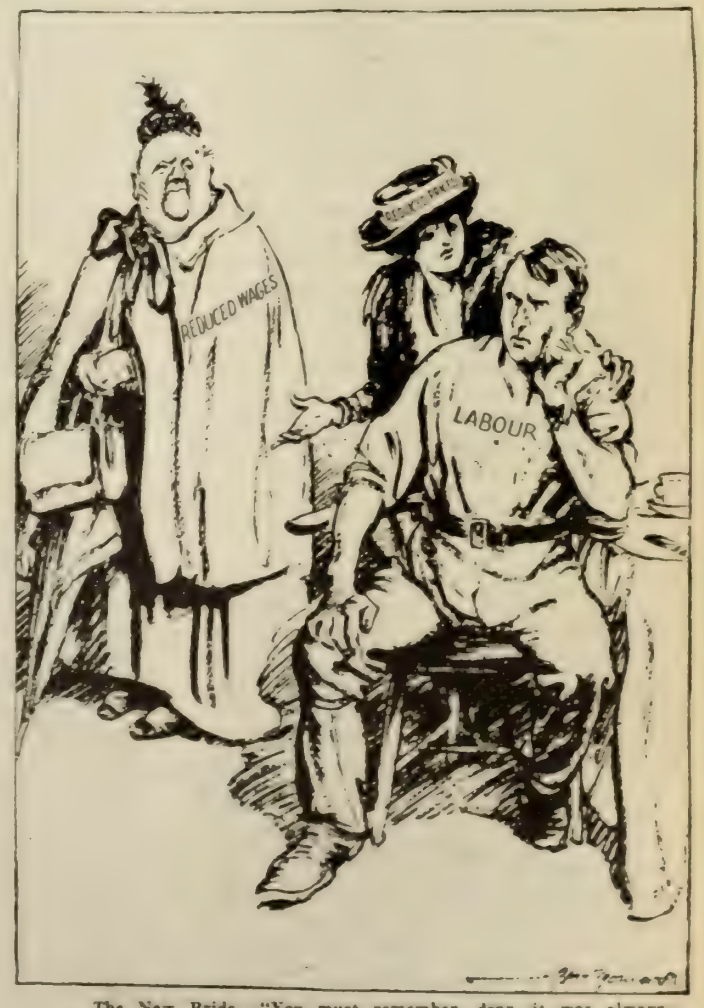
## FIVE U.S. FIRMS HAVE GONE TO BORDER CITIES IN THREE WEEKS

### Depression Not as Severe in This District as in Many Other Centres—Bank Clearings Show Increases—Must Get Down to First Principles

By F. MACLURE SCLANDERS,
Commissioner Border Chamber of Commerce.



WINDSOR.—So far as concerns these Border Cities, we are exceedingly fortunate. The depression does not seem to have affected us in any noticeable way. Quite a percentage of our large retailers recently interviewed by me report a bigger business for last month than they did in April 1920.

Most of our manufacturers who had closed down have again resumed, some of them on full time. On the whole, we have no reason to complain down here at this southermost corner of Canada. But, we have much reason for gratitude.

It may interest to add that the Americans have certainly not lost confidence in Canada and her industrial possibilities, for within the past three weeks no fewer than five American branch factories have located with us which now gives us upwards of two hundred-and-twenty of such—and they are all doing well.

According to the "FINANCIAL POST," issue 13th inst., the Windsor bank clearings were the only ones in all Canada which indicated an increase. (These do not include the bank clearings for the other border municipalities.) We are apparently less affected by the present depression than any other point.

If in 1913, for instance, we had enjoyed the volume of business that is ours to-day, we should have deemed ourselves wonderfully busy. The trouble with so many of us is that the hysterical activity of the war and the post-war period has implanted in us false conceptions of what is really meant by being normally busy, and has always meant prior to the war. In fact, our present conception of normal standards is really abnormal, and not normal at all. The war is over—a circumstance which, somehow or other, seems to be exceedingly difficult for many to realize; and, in my opinion, things will not be right until we have become reconciled once more to old-fashioned hours, wages and profits—until we have got away from the silk-shirt, patent-boot period, and returned heartily and sincerely to our work. This consummation so devoutly

The New Bride.—"You must remember, dear, it was always understood that mother should come and live with us when we were married."

—Thomas in "World Wide."

to be wished is not, I am respectfully convinced, so remote as many now anticipate.

Automatic law operating through economic exigencies cannot be effectively or permenently impeded by the creation of artificial obstacles.

The operation of this law is as immutable as the rising and setting of the sun; the ebb and flow of the tide. Therefore, our effort should be to strive with all our intelligence to escape as much as possible of the tribulation through which the automatic law in question invariably works; and to this end the exercise of common sense is absolutely imperative.

To revert to the Border Cities—it would almost seem that we are here in a little kingdom of our own and to some extent apart and away from the outer world; and from that outer world, there comes to us, as from a distance, the murmur of things that are so much duller and more disquieting than we here are conscious of.

* * *

## CONDITIONS ARE IMPROVING IN INDUSTRIES ON PACIFIC COAST

### Metal Trades Are Down Owing to the Falling Off in Lumber Industry—Other Lines Are Looking Forward to a Better Season

By W. E. PAYNE,
Secretary Vancouver Board of Trade.

VANCOUVER.—We have it on the authority of a prominent business man of this city, who went East in March last, that he came to the conclusion as the result of his observations, that at no time during the recent slump have business conditions been so depressed here as in other parts of Canada, and some parts of the United States.

Now, referring more particularly to the line which your journal represents, we have to report that the metal trades are at present only working 50 per cent of the capacity of the plants. This is largely accounted for by the fact that the lumber mills, on which the metal trades are dependent for the greater part of their business, are very slack, neither are they having their plants overhauled as is usual in the early part of the year.

However, last year the first five months were very quiet in the lumber industry, and afterwards business picked up to such an extent that the year's total was very large.

As regards fruit canning, although large stocks of jams, etc., are still held, put up when the price paid for fruit was very high, it is probable that as fruit will be obtainable at a much lower figure this year, more than ever before will be canned, as this will enable the canners to average up.

As to salmon canning, only sockeye will be put up this year, and the outlook for that branch of the industry is good.

Mining, of course, is quiet, as it is all over the world, and will be until prices improve owing to increased demand.

The pulp and paper industry is very flourishing and all plants working up to capacity.

* * *

## CONDITIONS IN GUELPH REMAIN GOOD—FACTORIES NEARLY ALL BUSY

### Only Two of the Shops Are Closed Down—Diversity of Industry Makes it Possible to Provide Employment—Merchants Have No Complaints to Make

By H. WESTOBY,
Secretary Guelph Chamber of Commerce.

GUELPH—There are 126 manufacturers in Guelph and of this number only two have been closed down because of lack of orders, and one of those only in part, the foundry portion still being in operation. Several of the local factories are running on short time, but against this we have a number who are working overtime, so that as a whole, the manufacturing conditions in Guelph are exceptional when one takes everything into consideration.

The merchants of Guelph appear to be all busy and I have heard of no complaints from any of these as to any general slackening up in business activities. The building trade, which is often like a barometer, is unusually active at the present time and a large number of new houses in the city and several important buildings are being erected at the Ontario Agricultural College.

Guelph is exceedingly fortunate, inasmuch as its industries are very diversified in their character and therefore any general slump in business does not very materially affect the business life of this city itself. It is expected that one of the local industries will erect a large, modern foundry some time during the current year, and another industry, if a certain site can be secured, is expected to erect a new factory in this city.

The manufacturers and merchants are hopeful for the future and the general expectations are that business will expand during the late summer and possibly grow into volume again.

---

## Steel Direct from Iron Ore

AN article published in "The Matin," Paris, by Charles Nordman, presents the claims of M. Basset, who holds that he can produce steel direct from iron ore, eliminating the costly pig iron process.

"At present steel metallurgy all over the world," writes Nordman, "consists in mixing in strong blast furnaces alternate layers of oxide, iron and coke. From the blast furnace at the end of its work we get the pig iron, brittle and unusable because it is loaded with carbon. It is then necessary to squeeze pig iron from its carbon by a second operation—that of converters—which at last gives forth real steel.

"All efforts to produce steel direct in one single operation have, up to the present, failed. When carbon burns in the oxygen of air or iron ore it emits some 2,500 calories of heat per kilogram. When this oxide carbon burns, in turn forming carbonic acid, it emits 5,500 additional calories. But carbonic acid at high temperature, as with air, burns iron, giving the iron part of its oxygen, and it is for this reason that into the blast furnaces must be placed an excess of carbon which will take up more quickly the iron oxygen that the carbonic acid emits in formation, and that is the reason why when one seeks to turn all the mineral in the blast furnace into iron one gets only pig iron.

**Dilemma of Makers**

"There is, therefore, this dilemma: To put in the furnace much coal and little air, which gives only pig iron, or to put in much air and little coal, in which case the major part of the iron is reoxidized. For these reasons experts have said that the economical production of steel was a Utopia which could not be realized.

"But Basset has made this dream a reality. Basset reduces the iron oxide by using exactly the amount of carbon needed. This operation takes place—and this is the original idea of Basset—in a chamber having a high temperature, into which is blown powdered carbon and air already raised to a temperature between 700 and 1,000 degrees. This powdered carbon is admitted in quantity to produce in burning, in the heated air, only oxide carbon, but the heat thus emitted, the air being previously at a high temperature, is nevertheless very high, sufficient to assure the rapid and almost complete reduction of the mineral and the production of steel direct.

**Five-hour Operation**

"By this system there is realized, in five hours' operation, what takes six times as long in blast furnaces, and its result is that one obtains from the chamber direct a stream of steel formed without an appreciable loss of mineral."

# Machining a Large Gear Blank on the Automatic

## Principle of Design—Various Attachments Used—Tooling For Large Gear Blank—Set-up For Long Shaft—Making Bearings Out of Tubing—Tool Layouts For Hubs and Spark Plug Shells

By J. H. MOORE

HAVE you ever had the opportunity of looking at any woodcuts of old-time machinery? If you have, then ten chances to one you muttered to yourself something along the same trend as the writer, viz., "How on earth did they ever turn out work with such crude and clumsy machinery?"

In those days, however, the demand for production was not quite so pronounced. In fact it is questionable if they held the word in the same respect as we do in this present era. Automobiles were unknown; there was no need for haste; and in every way conditions were opposite to those now existent. To-day production costs must be kept as low as possible if we are to successfully compete with other similar lines. Hand work, or even slow machine operations are practically a thing of the past. True, assembling is still accomplished by hand, but even there, mechanical moving devices speed up the work. The development of machinery has been nothing short of marvelous. This holds especially true regarding automatic machines. In practically every branch of industry we have machines which have been gradually developed up to the point where every possible movement is completed automatically. Enter a textile manufacturing plant, view the modern equipment used, and you will come out convinced that we live in a marvelous age. Go through an up-to-date manufacturing plant, note the row upon row of different types of automatic machinery, and you will become still more convinced that our machine tool designers have much to be proud of.

In the April 14 issue of Canadian Machinery we presented an article on automatic machine operations as performed on one type of machine, and through the courtesy of the National Acme Manufacturing Co., Cleveland, Ohio, we are now able to present examples of work produced on some of their types of automatics.

### Principle of Design

Both the Gridley and Acme type of automatic, produced by this concern, have four work spindles, these being held in a spindle carrier which is rotated by gears. The carrier is so indexed that the work is brought consecutively into position for the various tools. As all the turret tools are at work on different bars at the same time, it is obvious that the time required to produce one piece is only that necessary for performing the longest single operation, plus the time required for moving the turret, revolving the cylinder one-quarter revolution, and moving the turret slide forward again until the tools are in the cutting position. In some cases, however, the longest single operation is accomplished from the cross slide, and in such case the time required for the cutting off, or forming operation, plus the idle movements mentioned above would be the total production time.

In many cases it is possible to complete a piece in less time than the time required for the longest cut. Take, for example, a long milling cut, which can be divided between the box tools in the first and second positions. In that case the time for the completion of the piece is considerably less than the usual time for box turning, being slightly more than half.

In drilling, three tools are frequently used in this manner, so that only a trifle over one-third of the time necessary for drilling the hole is required to complete the piece. The feeding of the bar takes place between the first and fourth positions, when the cylinder is indexing (on the smaller machines) and in the first position on the larger machines, the stop swinging out of the way before the tools approach the work.

These machines have eight standard tool positions, namely, four end working tools, two horizontal forming and cut-off slides, and two stop slides working in the second and third positions. With this arrangement it is possible to have two tools working on each of the four bars at one time. This is, of course a great advantage from production standpoint. The only idle or non-productive moments in the style of machines under discussion are the withdrawing of tools, and indexing the cylinder carrying the work spindles. These moments occur at the completion of each piece.

No general rule can be stated as to tooling, or the use of same, as that depends entirely on the nature of the piece. As a general rule the operations performed at first position are forming (with a tool held on forming side), turning, drilling, facing, counterboring, etc., with tools working from the end and held in the main tool slide.

The second position is sometimes as follows: From the end we might have turning with box tools, drilling, reaming, countersinking, counterboring, facing, etc. We might also have such operations as shaving, light forming, burling and frequently thread rolling can be performed at this position.

In the third station, such operations

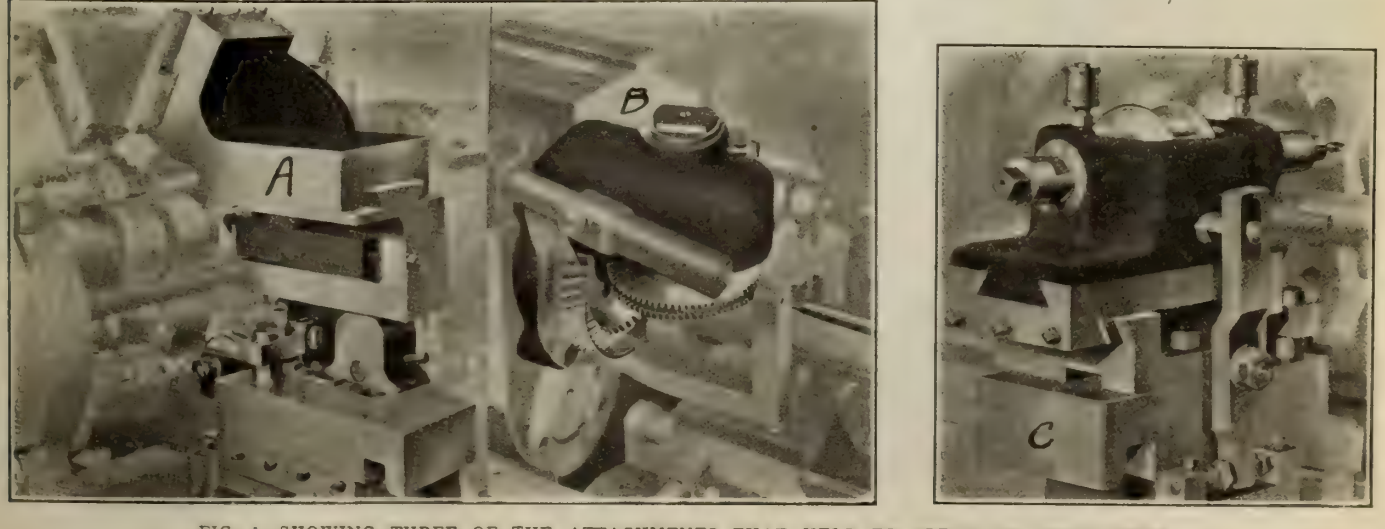


FIG. 1—SHOWING THREE OF THE ATTACHMENTS THAT HELP TO SPEED UP PRODUCTION.

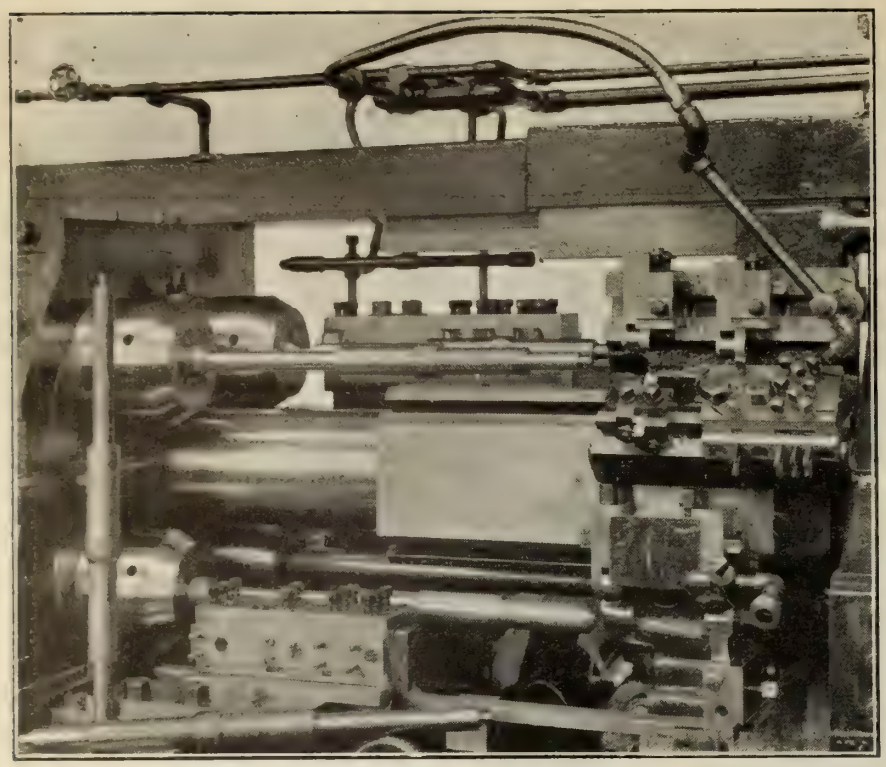

FIG. 4—MACHINING A LONG SHAFT ON A MULTIPLE SPINDLE AUTOMATIC.

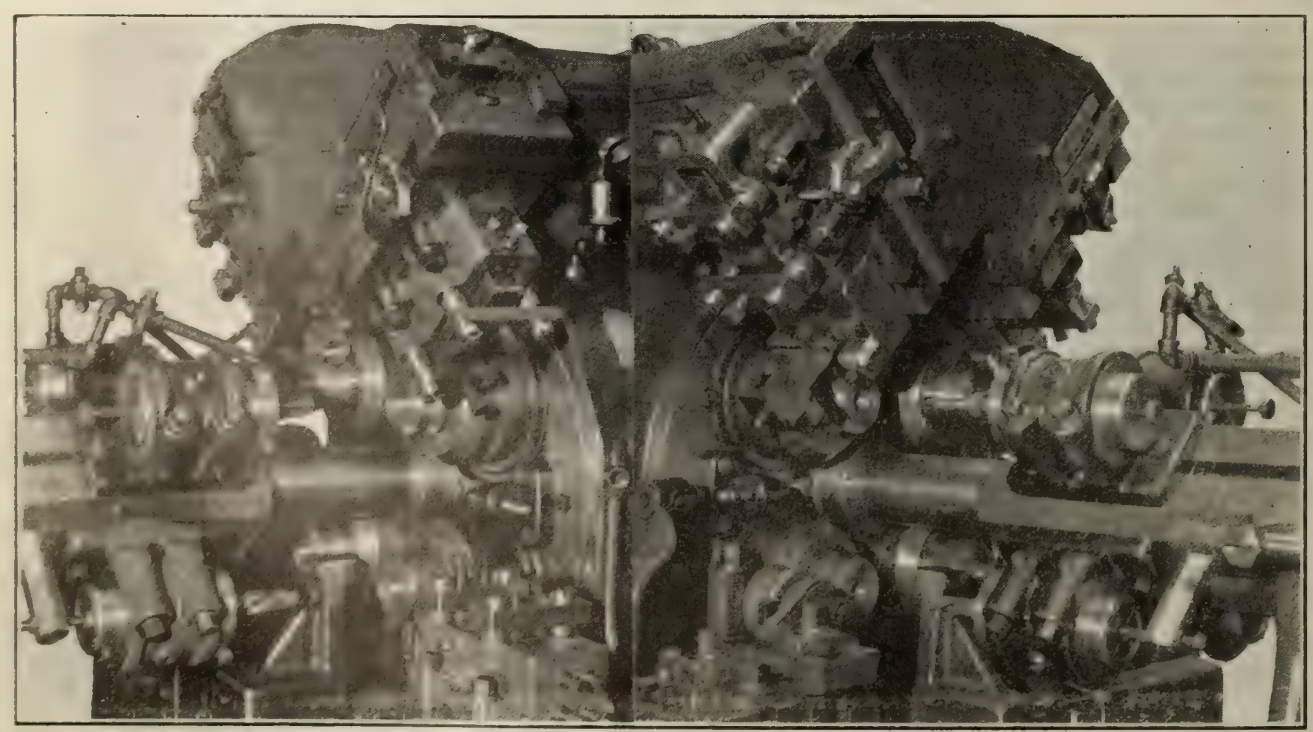

as threading (with dies, taps or chasers), drilling, reaming, counterboring, etc., can be performed, while turning with a box tool can be accomplished from the end. This position also lends itself admirably to the use of special attachments for milling, cross drilling, etc., their use being made possible because of the fact that the rotation of work spindle can be stopped in this position for the threading operation. Shaving, thread rolling and knurling operations are often performed in this position, the tools being held on the top slide, and operated in this position.

The fourth and last position is used in many ways. The slide working tool cuts the piece off, in some cases after a forming operation has been performed. Tools from the end can counterbore, countersink, ream, recess, drill or turn. In many cases a variety of these stated operations are combined, in order to still further speed up production. The study of proper tooling on any style machine is a very important one, and the same condition holds good on these machines. By a careful study of the product, maximum production tooling can be installed. In this regard, the company whose machines we are describing lend valuable aid and suggestions.

### Various Attachments

The labor saving idea embodied in these machines has been carried further, through the use of special attachments. These take the place, partly or entirely, of extra machines of standard types such as milling machines, drill presses, slotting machines, in fact in some cases take the place of special machinery. Such attachments are easily placed in position and save a large amount on the labor cost as they can be used without adding to the production time which would be required, even if the attachment were not used.

These additional production getters cover quite a field, including cross-drilling, reaming, countersinking, counterboring from the side, milling, slabbing, slotting, etc., from both side and end. Fig. 1 depicts three of these attachments. At A is shown an auxiliary forming attachment. When forming cuts are especially heavy, either very wide or deep, it is wise policy to use two or more forming tools. On the Acme type of machine additional forming tools can be used while the first one is cutting, to shorten the total forming time. This method has another advantage insomuch that the last tool leaves a better finish than a single tool for all forming operations could be expected to give. The attachment shown permits of the use of two or three forming tools, and, when

FIGS. 2 AND 3 SHOWING THE FIRST TO FOURTH POSITIONS IN THE MACHINING OF A LARGE GEAR BLANK.

used, the stock is fed on the cut-off side of machine in the bottom position, which is the usual cut-off position; and the first forming tool is used in the regular cross tool slide. The bar is then indexed to what is usually referred to as the first position, that is the lower one on the forming side of machine, where the second forming tool, in the regular forming slide, completes the rough forming of the piece.

A shaving tool is used for finishing in the position just above the second forming tool; and a special cross slide for cutting off is attached to the top bracket and used in the third (the threading) position. It is supported and operated from the regular side working tool slide on the cutting off side of machine.

One advantage of such an arrangement is the distribution of the strain of heavy forming cuts, but of course the most important advantage is the gain in both production and quality of finish.

Then there is the attachment for slabbing and slotting. This is shown at B, Fig. 1. One, two or three slitting saws or milling cutters can be used on this style of attachment, and they can be set horizontally, vertically, or can be swung to any desired angle in between.

Many parts which are made on screw machines are drilled from the side after being completed on the automatics. On these machines most of the work can be finished, including the drilling, during the making of the part, without adding to the production time.

When the bar is stopped for threading in the third position, the drill performs its work as shown at C, Fig. 1. The drilling tool is held in an auxiliary spindle as shown, and the attachment itself is mounted on the cross slide just above the cut-off tool. The attachment is advanced by the same cam that operates the cut-off slide, and when it is necessary to pass the drill clean through the piece, the attachment is arranged to feed farther and faster than the cutting off slide. The drill spindle is driven from a belt from a special countershaft, or by being coupled to the spindle driving gear in the main tool slide. By the use of this attachment operations such as counterboring, straight or taper reaming, countersinking, from one or both sides, and the drilling of two holes, either of the same or different sizes, can be accomplished. Other similar operations of which there is no need to enter in detail can be likewise performed.

Frequently it becomes possible to combine two of these special operations and to perform both of them at the same time, while the other operations on the piece are proceeding. Where necessary, it is possible to use at the same time two milling attachments, one from the side and one from the end; or a milling attachment from the end, and a drill from the side; or a combined mill and drill from the side, a mill from the side and a drill from the top. Two drilling attachments, one from the side, and one from the top, can be used, in fact it is not an infrequent arrangement. In addition to the above there are special threading attachments, self-opening dies, various milling fixtures, reaming attachments, special tools, etc. In many cases the use of one or more of such attachments has increased production to such an extent that the original cost has been absorbed in very little time. The chief point to watch is this. Do as much as you can to the piece before it leaves the machine, as quite often small additional operations cost as much, if not more, than the automatic work on the piece. It is a wise policy to study the problem yourself, then put it up to the makers of the machine, letting their engineering staff, who are specially trained on such work, give you the benefit of their opinion. Leaving the subject of the machines and their attachments, we will next consider examples of work performed.

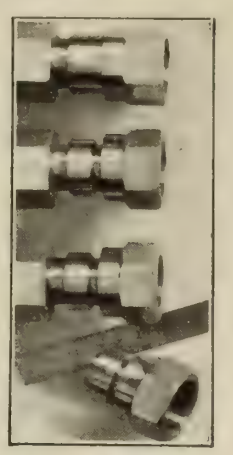

FIG. 6—STEPS IN THE MAKING OF A SPARK PLUG SHELL.

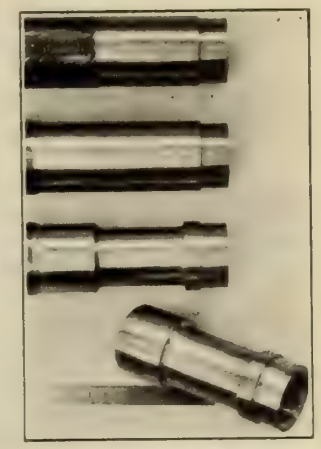
**Examples of Work**

Fig. 2 illustrates the tooling on the first and second positions of a large gear



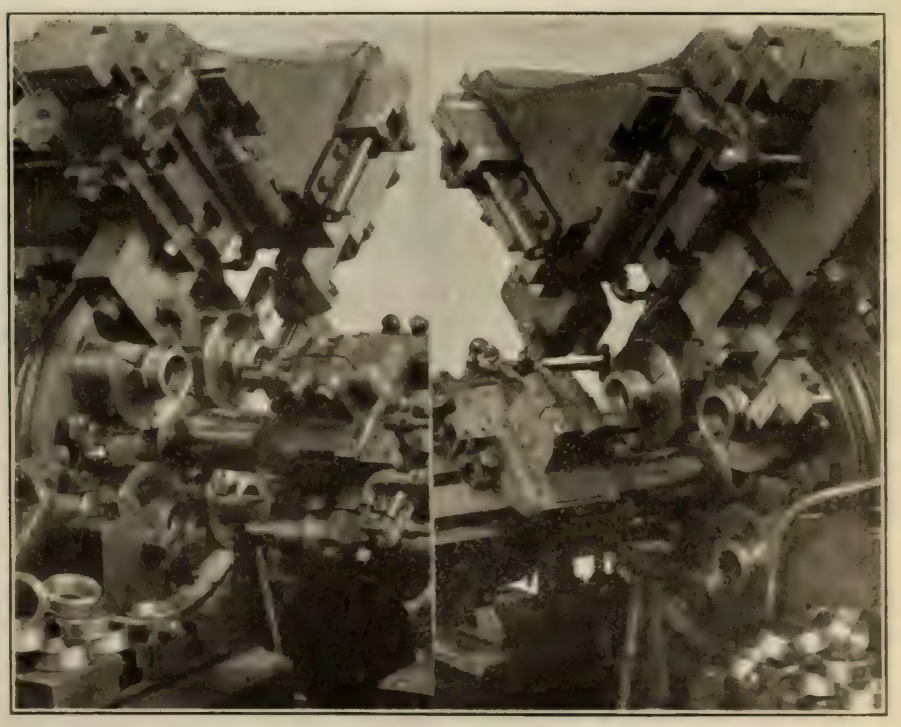


FIG. 7—VARIOUS STEPS IN PRODUCTION OF A MASTER PUSHER.

blank. This photograph also affords a splendid view of the top slide. The opposite picture, Fig. 3, shows the third and fourth positions on the same piece. By glancing at both these views the complete tooling is seen. This blank was completed on a 3¾-inch Acme multiple spindle automatic screw machine of the latest type. Unfortunately we have no production figures on this or any of the pieces to follow.

The next view, Fig. 4, depicts the machining of a long shaft on a Gridley multiple spindle automatic. The photograph shows the tool set up from the forming slide side of the machine, and pieces of this sort are formed, nicked, turned, recessed and cut off simultaneously; as many as 15 or 16 dimensions having been machined on one shaft, all

PRODUCING A BEARING FROM TUBING ON A NEW STYLE ACME MULTIPLE SPINDLE AUTOMATIC.

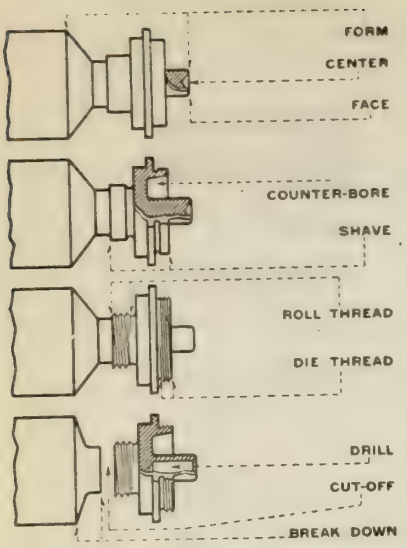

FIG. 5 SHOWING HOW THE PART IS COMPLETED.

at one time. The completed shaft can be noted in the photograph, and when we state that it is about 16 inches long and 1½ inches diameter at its largest point, readers can form the rest of the proportions quite easily. Following is the mode of procedure in machining.

First position—form and turn; second position—finish and turn; third position—finish form and recess; and last position—cut off.

Fig. 5 depicts an interesting job on the new style Acme multiple spindle automatic. This is a bearing job, and tubing is used for the work. First, the part is rough formed, rough bored and faced. In the second position the work is finish formed, rough taper bored, and a radius completed. Third, the part is finish taper bored, shaved and faced. The last position, as usual, is cutting off. Both right and left hand views are taken of the same piece and some of the finished product can be noticed resting on the tool slide.

At Fig. 6 are shown the steps in the making of a spark plug shell. First, the part is rough formed and drilled part way. Secondly, it is finish formed, drilled and chamfered. The third position is devoted to tapping, while the last position completes the drilling, also cuts off.

Fig. 7 illustrates the steps in the making of a master pusher. First, the piece is rough turned and partially drilled. Next comes the finish turning, and finish drilling. At the third position the part is formed and reamed, while at the fourth and last position it is cut off.

Fig. 8 shows in diagram form an interesting piece of work. It will be noted that the first position is taken up with forming, centering, and facing, while the second shaves and counterbores. One thread is rolled, and the other cut with a die at the third position, and the piece is drilled, broken down, and cut off in the fourth position.

The piece shown at Fig. 9 is completed as follows: First position—forming and drilling of large hole. Second, the small hole is drilled, and the outside shaved. The third position is used for tapping, while the small hole is reamed, and the part cut off in the last position.

Fig. 10 depicts a hub which is an interesting part to complete. First a hole is drilled half way, and the part is rough formed. Next comes the completing of the hole, and the finish forming of the piece. Third, the part is shaved and counterbored, while in the last position two different diameters are reamed and the piece cut off.

The example shown at Fig. 11 is centered, faced and rough formed in the first position; drilled and shaved in the second; tapped and the thread rolled in the third; while a small hole is drilled and the piece cut off in the fourth position.

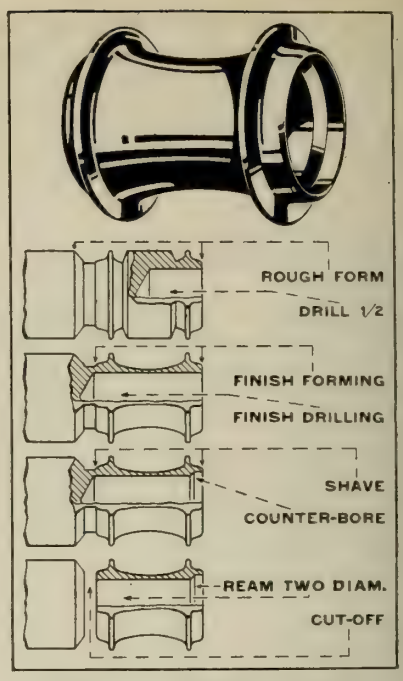

FIG. 10—COMPLETING A HUB.

Fig. 12 is first formed and milled on the end, after which it is formed at another portion, and pointed in the second position. In the third position the part is threaded and milled, while in the fourth position the usual cut off operation is performed.

### Miscellaneous

On parts which cannot profitably be made from bars because of irregularity of shape, or amount of valuable material cut away, the magazine feed is usually used. The parts in such cases are fed down the magazines, or loaders if one cares to call them that, where they are automatically fed into the spindles and chucked in place. After the pieces are completed they are extracted automatically by means of plungers in the spindles.

In some instances the shape of the piece makes it impossible to feed by use of the magazine. In such cases they are inserted by hand, but when this occurs

# Review of Canadian Machinery Drafting Course

## Mechanical Drawing Defined—T-Square Practice—Use of Various Instruments—Triangle Exercise—Compass and Ruling Pen Hints—Practice Plates—Uses of the Triangle—Lettering

By J. H. MOORE

SOME time ago Canadian Machinery commenced a series of articles on mechanical drawing. It was our intention at that time to continue these lessons, but other plans prevented. Numerous requests have been received suggesting that we take up these lessons once more, so, for the benefit of those who did not have an opportunity of starting the previous articles, we have decided to review in as brief a manner as possible, the data embodied in the former lessons. From that point on, we shall go further into the subject, taking up later questions in design.

We will endeavor to touch only on the essential points, as we intend making the lessons especially suitable to apprentices and mechanics who desire a grounding in the principles of mechanical drawing. Close study of these articles, should, in an indirect manner, increase your earning power.

### Mechanical Drawing

Briefly, mechanical drawing is the art of showing graphically details of machinery. It is the language by which the draftsman speaks to the workman. A brief study of a well prepared drawing should explain fully the idea of the designer, and if a mechanic understands the principles of mechanical drawing he not only makes his own task easier, but is a help to the designer, in so far as the carrying out of the drawing is concerned. Not only should apprentices and mechanics learn to grasp the principles involved in mechanical drawing, but they should practise at home, and in the technical school, some simple drawing, leading up later to more intricate work.

Any good grade of paper can be used to draw on, and at Fig. 1 is shown the chief instruments required in drawing work. A shows the drawing-board; B, the T-square; C, two triangles, both 45 degree, and 60-30 degree, while at D is depicted the regular style of triangular scale adopted. E shows a simple style of protractor, while F illustrates some of the instruments used. G depicts the irregular curve and its uses, while H shows the usual method of sharpening drawing pencils. In addition to the above, thumb tacks are used to fasten down the paper. Lead pencils graded from H to 4H are best suited for drawing, and the pencils should be sharpened with a chisel edge as shown at H. In drawing, the student should place the chisel edge against the T-spare, or triangle, this enabling him to draw a clean-cut fine line through any points.

The T-square gets its name from its appearance. To illustrate the use of the T-square we have prepared Fig. 2. Always keep the head A up against the left hand edge of the board, otherwise the various lines drawn will not be parallel. For practice proceed as follows: Fasten a sheet of paper to the board and draw a line B, making this line 6 inches long. Next, lower your T-square a distance of 5 inches and draw another line. Without moving your T-square, project down from the extremities of the first 6-inch line, the two lines, C and D. Use your scale at this point, measuring down a distance of 1 inch each time as shown on sketch. Having done this, use your T-square to produce the lines E, F, G and H. This may seem an extremely simple exercise, but its chief object is to give you control. At first you will find you want to run all over the lines, but keep on until you have perfect control over the hand, making sure that every parallel line touches, but does not run over the vertical lines C and D.

At Fig. 3 is shown an easy method of holding the compass; the correct and incorrect method of holding the ruling pen; also a view of how the hand would appear if held in the proper position. Study these views carefully, keeping the following points in mind. Make sure when using the ruling pen that both blades bear evenly on the paper. If they do, the resulting line will be smooth and even. A common danger is shown at A and B. First there is a tendency to get too great a slope outward, then second, there is a like possibility of coming too far inward. If good work is to be obtained you must hold your pen upright as shown at C. If you follow out this advice, your hand will take the position

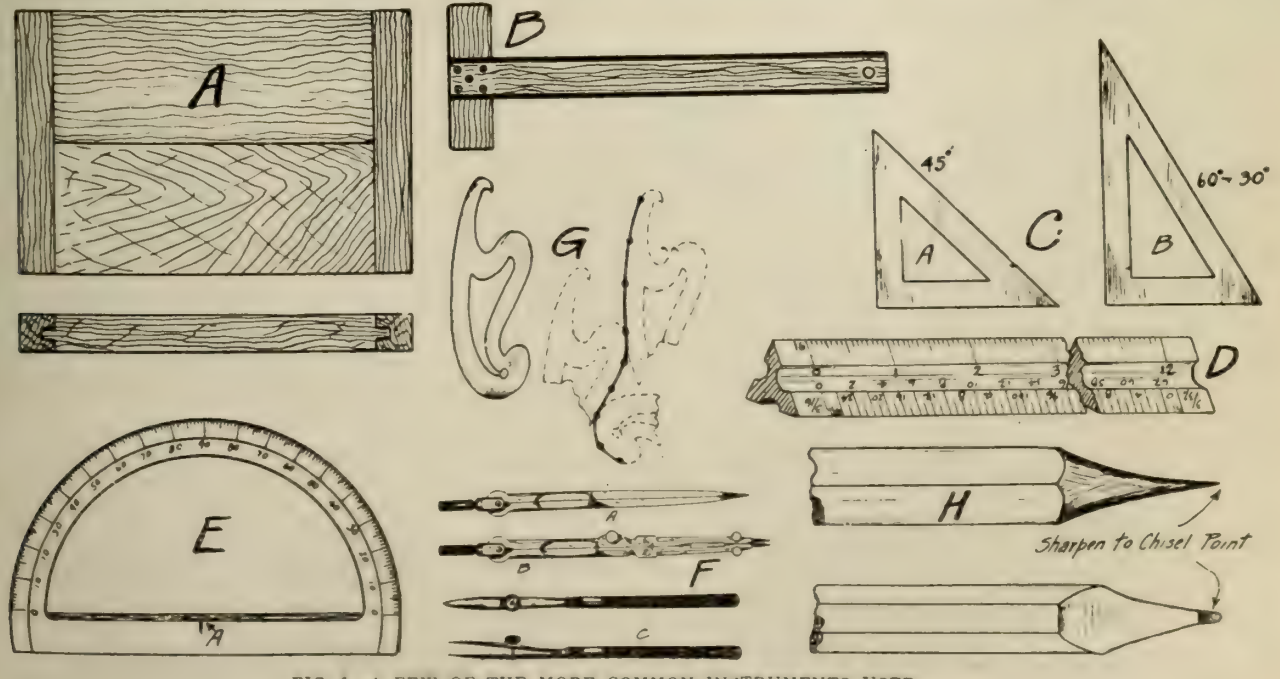

FIG. 1—A FEW OF THE MORE COMMON INSTRUMENTS USED.

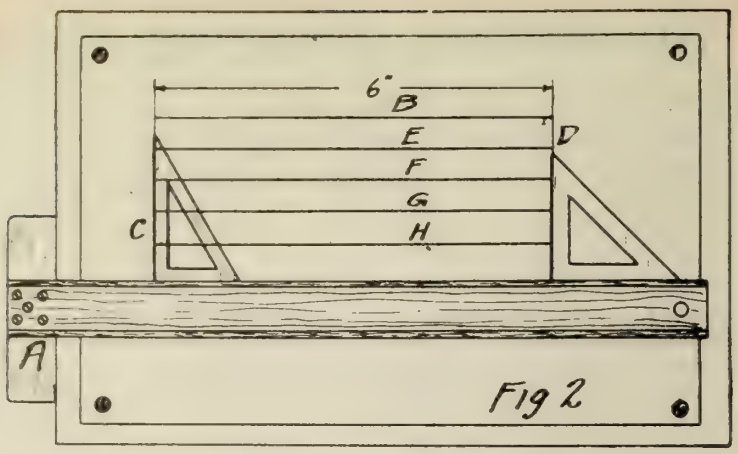

FIG. 2 A SIMPLE LESSON IN THE USE OF THE T-SQUARE.

shown at D. Should you blot quite a bit at the start do not get discouraged. The writer made many a blot before he was able to make a drawing. In fact many a drawing he spoiled in the earlier days. Use only a good grade of India ink.

When you feel you are proficient at exercise No. 2, and you have practised drawing ink lines with the ruling pen, start on the lesson shown at Fig. 4. Work to the dimensions shown; lay out the four sections one by one; draw the various lines; but keep in mind that control of both the hand and instruments is what you are striving for. Stay at the work until you can turn out a neat exercise.

On completing Fig. 4, start on Fig. 5. This plate will give you both pen and compass practice. Another good practice sheet is shown at Fig. 6. This exercise covers various uses of the triangle. Section 1 illustrates a very common use, viz., drawing parallel lines at an angle to the horizontal by means of the T-square and triangle. Section 2 depicts the use of triangles only and illustrates the method of drawing a line parallel to a given line. First place triangle A with one edge conciding with the line B C. Next take triangle D and place one of its edges in contact with the bottom edge of triangle A. Hold the triangle D firmly with the left hand and slide the set square A to the right or left as desired, until you reach the point through which you wish to draw the line E F. It will be noted that we used the term set square. This is another expression for the word triangle.

At section 3 is shown the method of combining the use of the 45 and 60-30 triangles with the T-square, in this way procuring an angle of 15 or 75 degrees. Section 4 illustrates the drawing of a rectangle by means of the triangle and T-square. First draw with the T-square the lines A B and C D. Use your triangle at this point, drawing the vertical lines C A and D B. This completes the rectangle.

At section 5 is shown another method of drawing a rectangle by means of triangles only. Place your 60-30 degree triangle A at whatever angle you desire, then place the 45 degree set square B on top as shown. In the dotted position you can draw in the short sides of the rectangle, while in the heavy position you can finish up the longer sides.

The remaining section No. 6 shows the method of drawing perpendicular lines to any given line by means of the T-square and triangle. From these little hints students can form some idea of the possibilities of such instruments and by practice will find these tools more useful as time goes on.

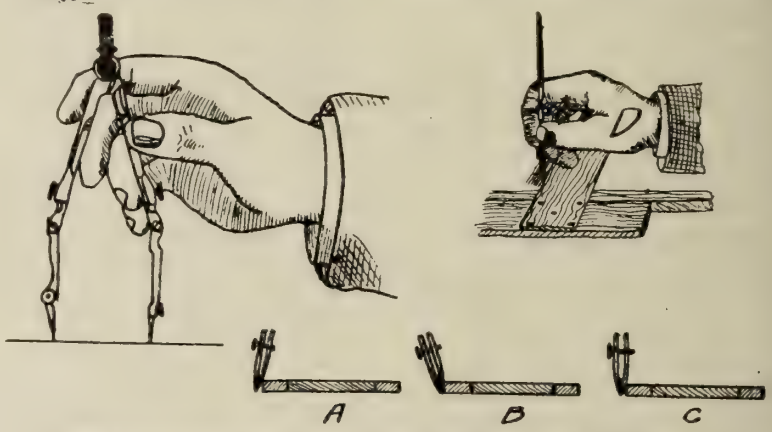

FIG. 3 THE CORRECT METHOD OF HOLDING THE COMPASS AND THE RULING PEN.

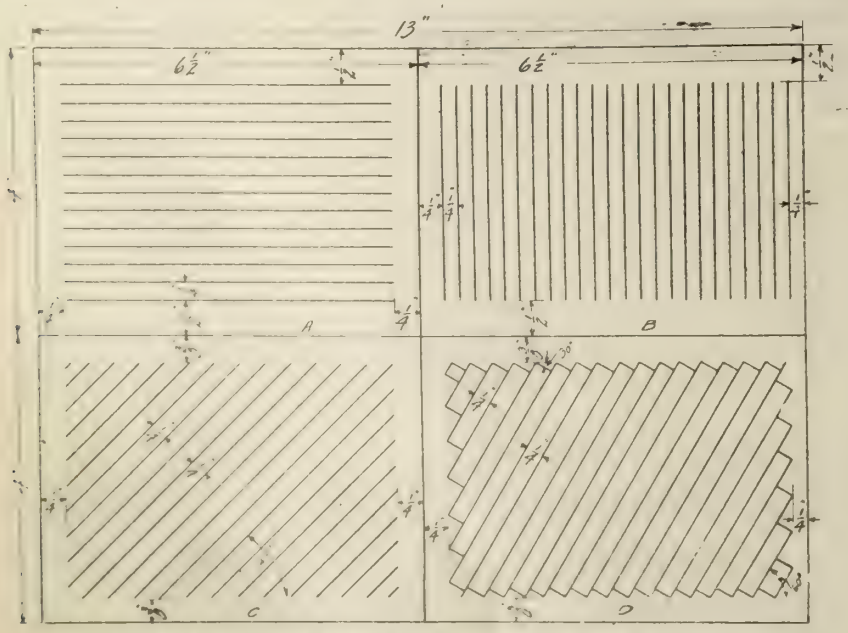

FIG. 4 A PRACTICE PLATE FOR CONTROL OF THE RULING PEN.

### Lettering

When you speak of lettering to the average student studying drawing, if you watch closely you will see his nose curl slightly as he remarks, "Gee whiz—lettering to my mind is a waste of time." But is it? We believe that lettering is as important as the drawing itself, and although we would not suggest that students spend a great deal of time on this subject alone, we do believe that a short period spent in practising lettering will be time well spent.

Fig. 7 illustrates how students can practice what is known as the plain Gothic style of lettering, with the aid of the T-square and triangle. To start with, use only a good pen nib. A Gillott No. 303 is ideal for such work. For illustrative purposes we have shown a few dimensions that can be followed. Make capital letters 5-32 in. high,, and the smaller, or lower case letters as they

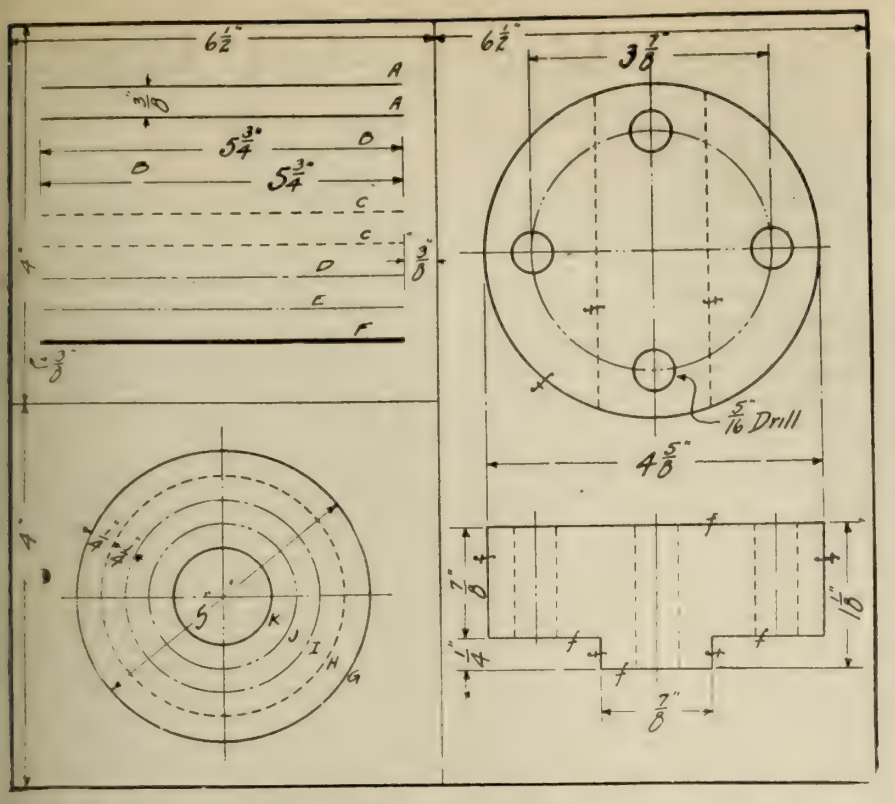

FIG. 5—THIS PLATE WILL GIVE YOU BOTH PEN AND COMPASS PRACTICE.

alternately placed at various angles, with the result that the appearance is very uneven. Some of the letters have also been prepared to illustrate the importance of touching both top and bottom guide lines.

To secure the regular slope, use the T-square and 60 degree triangle as shown in sketch. In lettering, make the backs and sides of the letters parallel with the sloping lines produced by the triangle. Here are a few hints regarding lettering. Never be over hasty. On line three, Fig. 7, are shown a few letters enlarged twice the actual size. To produce the letter A, draw the center line at the regular slope. From the apex draw a line almost perpendicular as shown, making the distance across the bottom of the letter about 3-16 inch. Regarding the other letters illustrated, by studying the same, students can easily grasp the style and proportion. Folow the copy closely, keep on practising, for you can learn more about lettering by actual practice than by any written instructions. The latter part of Fig. 7 shows the complete alphabet, both capitals and lower case together with a set of numerals 1 to 0. In our next lessons we will go further into lettering, section lining, and other subjects.

are called, ⅛ in. high. No definite rule can be given as to the spacing horizontally, but practice soon makes you more proficient in judging what is good spacing. What would perhaps help more than anything would be to remember that W is the widest letter, M and T the next widest, then A and B. The narrowest letters are I and J, after which all the rest are about equal.

Before beginning to letter, draw horizontal guide lines with the T-square to serve as a guide for the tops and bottoms of the letters; see lines A, B, C and D. The various letters should be made to extend fully up to the top, and down to the bottom. They should not fall short of the lines, for if they do the lettering will appear rough and uneven. It is also important that the letters have the same inclination. For example, in the first line of lettering in Fig. 7, the letters A, B, C, D and E have the same inclination. F, G, H, etc., are

# Making It Harder for a Man to Get Injured

## Carelessness is the Hardest Thing to Eliminate—Prompt Attention Given to Minor Injuries is Sure to Cut Down the Off-Work List—What Some Firms Are Doing in This Line

By JOHN T. ORR, Assistant to Superintendent, Toronto Works

THE chief point to watch in any safety device is to actually make it harder for the man to get injured. In speaking on the subject of "Safe-guarding Machinery," Mr. Orr brings this point out nicely, for in the final analysis it is the employee who is safeguarded, and it will be to his benefit more than to the company, where installations of safety guards are effected. But let the author tell his story in his own way.

Our company for many years has been working with the definite purpose of eliminating all hazardous work, and where a mechanical device is the cause of the hazard, a guard is promptly installed. The effort applies not only to safety attachments on machinery, but a protection to hazardous areas, open spaces, stairways, strong chemical gases, smoke, heat and dust.

Let us divide the types of safety devices into three classes, or let us consider three types of hazards that have to be met in a plant of this nature.

First is the hazard of defective material, overstrain, or wear.

Second, carelessness on the part of the operator, which might be due to sheer carelessness, fatigue, or illness.

Third, carelessness of other people, or purely dangerous conditions where a slip or misjudgment would result in accident.

Referring to hazards of the first type, these would likely come from belting or transmission machinery, elevators, hoists and equipment of a like nature. Belts are guarded by steel troughs or cases made strong enough to retain the belt in case of breakage. Emery wheel belts, lathe belts, belts to drill presses, wherever in an exposed position are protected in this way. All drive chains, sprockets, gears and other moving parts which are in any way likely to be a source of danger in their ordinary operating position or in case of their breakdown are encased in metal guards.

The guarding of emery wheels also would fall under this classification. These are guarded by a metal casing covering as much as is practical of the wheel, according to the different uses to which the wheel is subjected. In a general way, however, cast iron guards are used for guarding wheels to no greater than 14 inches in diameter, beyond which diameter, steel guards are used. All guards are sufficiently strong to retain a wheel in case of bursting.

The second cause of accidents is possibly one that requires the most careful consideration, and the greatest amount of thought. The chief danger to operators from this source is to be found in the design of the tool that they are expected to use. Jigs and fixtures should be made as far as possible fool proof from a safety standpoint, as much as they should be made fool-proof from the standpoint of the inspector. We can generally find in studying the design of simple tools that some are quite safe to handle, whereas others performing the same work are the very opposite; this is particularly true of punches and dies. We might surround our punch presses with patent safety devices, be as careful as we can in training our operators, but the greatest amount of safety lies in toolage which itself is not dangerous.

We cannot always, however, design our machine toolage so that it is so safe it is impossible for a person, no matter what foolish thing he may do, to get hurt, hence we must have in addition to carefully designed tools, other means of preventing a careless or inexperienced operator from being injured, and we put safety attachments of various sorts on our presses, guards, shields, safety sliding blocks, etc., etc., in combination with our tools to make them as much as possible fool-proof.

Accidents from the third source, while not so common, still always present a certain amount of danger, and in consequence must be guarded against. Rubber or cork matting in front of woodworking machines, posts and steel fencing to prevent truckers from coming in contact with operators, proper lighting and shielding of the steps, and floor openings; proper overhead protection, when there is any possibility of danger in that direction, and what is perhaps one of the best safeguards against a large number of accidents is a good general lighting system, in addition to the individual lights required at each machine.

In consequence of this work on the part of the company, the number of serious accidents is encouragingly small. In a plant with at times as high as three thousand employees, there is a very heavy turnover, with a consequent large number of "green" men. Our statistics show that it is the new man who is the cause of our greatest accident expense, and it is to him we direct all attention and educational effort.

On his signing up for employment, the new man is handed printed matter comprising our factory rules, industrial council constitution, employees' benefit society by-laws, and special literature directing his attention particularly to the necessity of safety to himself and to his fellow employees. Suggestions are given how this safety idea may be advanced by him to his own benefit, as well as making him acquainted with the fact that we have a medical director in charge of the first aid and fully equipped factory hospital, together with nurses for outside visiting service.

In addition to this, all men at the time they first come on the job are instructed in the hazards of their work and are warned of possible dangers by the foreman, gang boss or set-up man.

With a plant having its machinery and dangerous places guarded, there is no assurance that accidents will be entirely eliminated, as our records inform us that the larger portion of the injuries attended to by our medical department are the result of carelessness or thoughtlessness on the part of the individual, and only a very small percentage of the compensation cases recorded can be avoided by mechanical safety devices.

### Skilled Trades

The diversified nature of the work in our plant calls for skilled men in a large number of distinct trades, such as moulders, core makers, foundry men, smithy drop forge and furnace men, punch press and heavy duty, die and punch work, machine tool and all kinds of wood-working operations, skilled metal trades, machine and bench work and painters.

All of these men are subject to hazards peculiar to their trade class, and so that we may have the best thought on the subject, we have not only our master machanics' department, which is responsible for the installation and moving of all machinery, as well as the erection of safety guards, but we also have a safety representative in each shop who reports conditions to the employees' elected representative for his division which leads up to a safety and sanitation committee of our industrial council, consisting of four members, which puts into effect direct and indirect recommendations.

In our foundry constant effort is put forth to insure sound practical shoes worn by the moulders, and to facilitate this, we have on sale at cost price, a supple of these shoes for our men. We also are establishing the use of canvas leggings for men pouring iron, together with the use of goggles by men at the cupola.

In machine shops, all pulleys, belts, shifting levers, etc., are guarded and projecting set screws are eliminated or covered with safety collars.

### Education

Our experience is that education is the greatest influence in the factor of safety.

We begin with the employee on his becoming associated in our work and continue it through to the foreman. A good live foreman, appreciative of safety, will take a personal interest in his department with the view of eliminating as much as possible all accidents charged up to his work. Where there is a safety hazard, he will immediately have it guarded; where he has a careless employee, he will take corrective measures. In addition to personal literature, we have special safety notice boards placed at the main factory entrance, as well as at strategic points in many of the departments. We find these boards are read constantly by our employees, and as the printed matter is changed in every department every week, the interest in safety and personal health work is sustained.

### Fire Hazard

As many of you know, a considerable portion of the machines manufactured by our company are comprised largely of wood, in the handling of which not only in our outside lumber yards, but in the various primary, assembling, and finishing departments there is an acute fire hazard. It has been the policy of our management for a great many years to spend considerable sums in fire prevention devices, such as sprinkler and hose systems in order that there will be no possible chance of the plant being destroyed by fire. Notwithstanding all of these precautions, there is hardly a day goes by but a fire is reported, but it is usually in one place, namely, shavings distributed at the mouth of the furnaces heating our boilers. In the plant which has been in Toronto for over forty years, and working under these conditions, and not having a fire other than that which has been referred to, this is considered a splendid record. We are quite proud of this record, but are not letting up at any time in our protective measures, as our fire chief or his assistant is on duty day and night. We have day and night watchmen and a specially trained fire-fighting crew who are located in our fire hall quarters, on the factory premises.

### Shop Cleanliness

For a shop handling the class of work which we do, a very presentable appearance is shown and while we know there are plants with straight line production and less variety of work going through than we have, they as a consequence may show a cleaner and more orderly appearance, we are always striving to not only eliminate waste, but to get rid of waste and keep our grounds and buildings in a clean and orderly manner, and have all work in process move along naturally.

### Employees' Suggestion System

In addition to our own employees' suggestion system, where we give bonuses for practical suggestions, for safety as well as mechanical improvements, we have the benefits of regular visits of the inspectors of the Industrial Accident Prevention Association, with whom our safety engineers heartily co-operate. As recommendations are made, they are installed as promptly as circumstances will permit, and anything which will be helpful to the safety and good health of the employee is welcomed.

Our business at this particular time is not as pressing as it has been during former years, but there is absolutely no let up on that account in our efforts on behalf of the employees or the installation of safety devices.

As a matter of interest, might I quote some figures showing our accident statistics for the past two years, and during the past few months.

| | Jan. 1919 | Jan. 1920 | Jan. 1921 | Mch. 1921 |
|---|---|---|---|---|
| Average attendance . | 2211 | 1686 | 1689 | 1500 |
| Total monthly attendance First Aid.. | 1618 | 1259 | 1352 | 1409 |
| Compensation lost time.. | 17 | 10 | 8 | 10 |
| No lost time . | 4 | 3 | 5 | .. |
| Days lost on all cases during month | 396 | 187 | 108 | 169 |
| Average days lost time per case in month .... | 15 | 11 | 8 | 10 |
| Total compensation Expense ..... | 1901 | 1154 | 1424 | 758 |
| Injuries per 100 employees | 27 | 13 | 8 | 21 |
| Compensation cases per 100 employees | .95 | .77 | .76 | .67 |

Where we have 13 new accidents each day of more or less minor injuries, such as cuts, burns, bruises, etc., the number of compensation cases arising therefrom in each month is very small. In all cases of injury resulting in a compensation case, an immediate investigation is made and reported upon by the foreman of the department. This report is made to our medical director covering all phases of the situation, the employee, the work, and the scene of the accident with recommendations for future preventive steps. Such a report being demanded of, and prepared by the shop foreman, brings home to him personally his individual responsibility for the safety of the employees under his care, together with the hazardous conditions in his shop.

### Policy

In closing, let me say that the Massey-Harris Co. is entirely behind the safety movement. It has always been our policy to take care of the good health and welfare of our employees without introducing any spirit of paternalism, and the results we have obtained during the past few years since the inception of an active first aid department for working employees, together with a nurse to visit employees who are ill, or their families, and the recent appointment of Dr. Herbert W. Baker as our medical director is bringing out the highest results in the way of co-operation and better feeling between the management and men.

## BIG ADVANCES HAVE BEEN MADE IN LOOKING AFTER THE EMPLOYEE

THERE have been big advances made in keeping men at their work. We do not mean by this that anything has been done to prevent them laying off, but much has been done toward making them more fit for their work every day.

A few years back and little was known of medical practice in the shops and there are only a few of the larger concerns that have gone into this matter.

When a man took a piece of bark off his finger he used to stick it in a can of turpentine and then try and forget it. If dirt and foreign matter generally got into the cut. it was all part of the day's work. If necessary, a search might be made for some chap who generally had a little piece of black, flesh and pink court plaster in his hip pocket.

There is no doubt that years and years have been worse than lost to men because their injuries were not promptly attended to. A mechanic needs the use of every joint in his hands and fingers and any move that can help him retain these faculties to the highest degree deserves commendation.

In these articles we are showing what the Massey-Harris Co. are doing in this direction. The manner in which the equipment is arranged will be of interest and value to manufacturers generally who have these problems to face and the attention given to safeguarding those who work in the premises is also commendable.

A new type of plug has been placed on the French market. It is called the Bougiver, and has a glass insulator. The glass is run into the body of the plug when the latter is at a high temperature, and the joint thus made is said to be compression-tight. The insulator is also peculiar in that it completely fills all the space right down to the plug points.

# Some Various Examples of Turret Lathe Practice

## Machining a Clutch Gear—Two Operations Required—Producing a Large 315 Pound Steel Spindle—Some Special Tools—Machining Spoked Hand Wheels—Profiling With Cross-Sliding Tool

By A. H. Lloyd, B.Sc., M.B.E.

IT will no doubt be remembered that on February 3, February 17 and March 24 we published various examples of turret lathe practice as adopted by the Alfred Herbert Ltd., Coventry, England. In this the last part of the series, we will take up other interesting work completed on this particular style of turret lathe.

A rather good piece of work which shows the ability of the modern turret lathe to rough out at a rapid rate, yet finish accurately to size, occurs in the machining of a clutch gear, which is a component part of several of the "Herbert" turet lathe headstocks. The lay-out for the first operation is shown at Fig. 1, and this operation is being done on a "Herbert" No. 9 combination turret lathe. The rough material is a drop forging of 40 tons tensile strength, the largest diameter of which when finished is 7¼ inches; the overall length being 4¾ inches. At the first operation the forging is gripped with special jaws on the boss, an end location being obtained by lengthened screws in the chuck jaws. The first tool is an inserted cutter drill with oil supply. In this drilled hole, counterbore No. 2 pilots and roughly opens out the ball race diameter. Tool No. 3 is a rough facing tool for the end, which operates simultaneously with No. 4, which is an adjustable knee turning tool carrying a counterbore for the large bore, a rough turning cutter for the outside diameter, and a chamfering cutter. By grouping all these cutters together so that they work at the same time, the most economical cutting speed can be employed. For instance, if the large counterbore had been used on station No. 2 and the small counterbore in the knee tool, it would have meant running both on the speed determined by the large diameter. No. 5 takes finishing cuts on surfaces similar to those operated on by tool 4; that is to say, finish boring the ball race, finish boring the large diameter, and finish turning. Simultaneously with this tool, No. 7 from the back of the cross slide is brought in for finish facing the end, and chamfering. No. 6, is a special tool holder in the square turret, carrying three cutters for facing the bottom of the bores and undercutting. No. 8 is a floating cutter bar for sizing the ball race diameter, and No. 9 a similar tool for the large diameter.

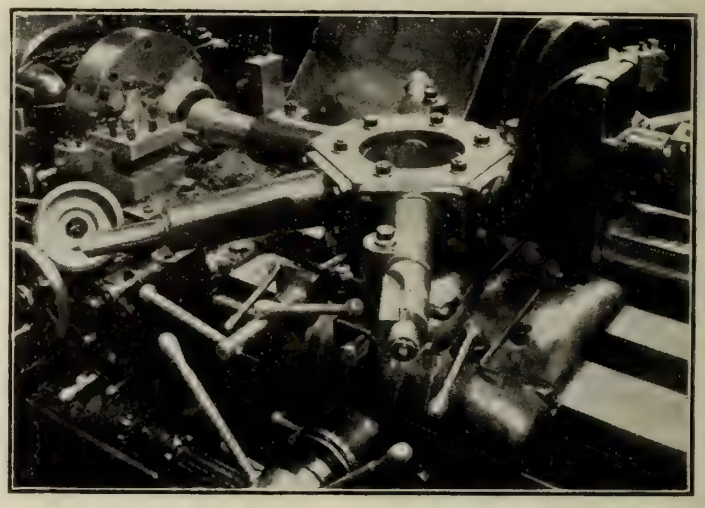

FIG. 2—PHOTOGRAPH OF THE FIRST OPERATION ON CLUTCH GEAR.

Fig. 2 shows a view of the machine set upon the first operation, and the piece as it leaves the chuck. During the operation of the large counterboring tool, the cut is very heavy just at the end of the travel, and tests the gripping qualities of the Coventry chuck very thoroughly. It will be noted that both counterbores, in addition to the drills are provided with oil tubes for conveying the lubricant to the cutting edges, thus enabling them to work under the most efficient conditions. The machining time for the first operation is minutes.

### Second Operation

In considering the second operation on this piece, we shall have an opportunity of going into a lay-out of tools for the automatic machine, known as the "Herbert" No. 5 auto lathe. This machine is in reality a turret lathe for dealing with detached pieces, on which all cutting operations proceed automatically after the work has been chucked. When the cycle is completed, the machine

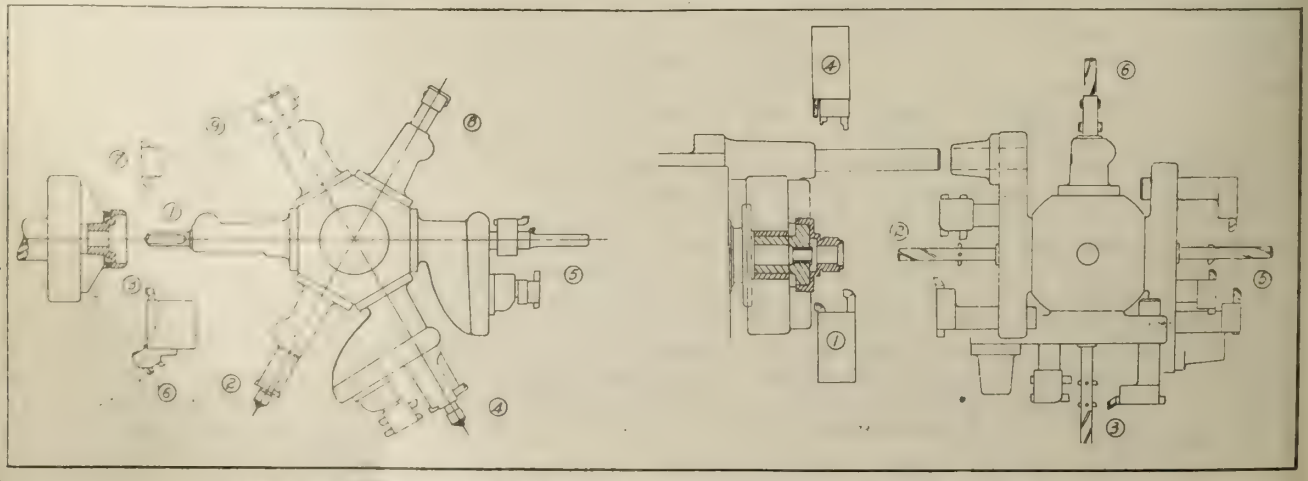

FIG. 1—LEFT HAND VIEW—SHOWING TOOL LAYOUT FOR CLUTCH GEAR.
FIG. 3—RIGHT HAND VIEW—THE SECOND OPERATION ON THE SAME PIECE.

stops automatically, a new piece is put in the chuck by the operator, and the machine is re-started. It is possible, therefore, for one operator to attend several machines, so that the labor cost per machine is very low.

Fig. 3 illustrates the lay-out for performing the second operation on the No. 5 auto lathe. The work is chucked true by a locating plug fitting in the chuck, which acts also as a steady bush for the boring bar, the work being gripped by soft jaws. No. 1, the front tool post, carries a pair of cutters for rough facing the large shoulder and the end. Simultaneously with the facing, a combination tool comes on to the work. This carries three turning cutters for the various diameters, and a boring bar with a cutter for opening out the second ball race. The tools on this turret face are timed to finish simultaneously with the facing tools. When this combination is working, it is obvious that as the cutters come on to the work successively, it is an advantage to vary the feed, in order to obtain maximum production. This particular lathe is provided with a valuable feature whereby the feed can be altered automatically during the cut, which thus enables the tools to start cutting at a coarse feed and change over progressively to finer feeds as the depth of the cut and the duty increases. No. 3 is a second combination tool, carrying finish boring and finish turning cutters. This operates simultaneously with No. 4, which is the standard back tool post in which are carried a gang of finish facing and grooving cutters. No. 5 is another combination tool, carrying a number of cutters for forming the various radii and chamfers. No. 6 is a floating cutter bar with two cutters for sizing the ball race and small bore simultaneously. The time for the second operation is 12 minutes.

At Fig. 4 you have a close-up view of the machine on the second operation, and it would be well to note the overhead support or pilot used, which is a very valuable feature on work of this

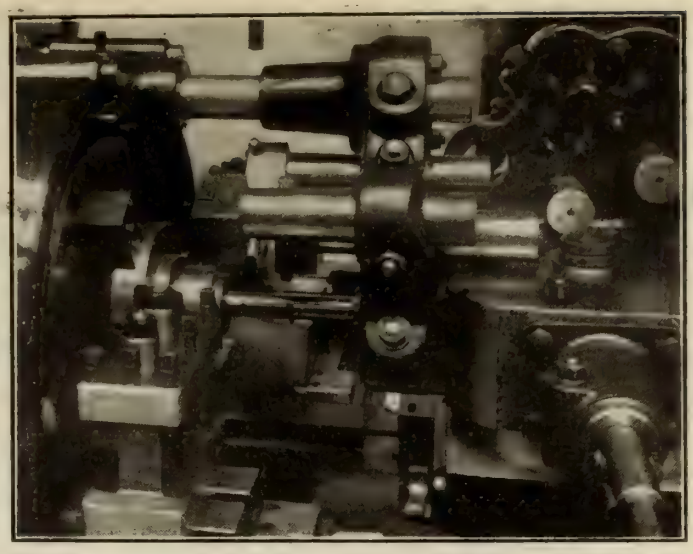

FIG. 4—CLOSE UP OF THE SECOND OPERATION ON CLUTCH GEAR.

class. It consists of a bracket bolted to the headstock which carries a steel bar 2 1-8 inches diameter. On each combination tool there is a pilot bush attached by three studs in clearance holes, so that the bush can be aligned true with the overhead bar. You will appreciate that this arrangement ties up the turret slide to the headstock very rigidly, and enables coarser feeds to be used and a greater accuracy to be obtained than would be possible without it. In many establishments large forgings are machined on ordinary lathes without considering the possibility of the turret lathe on this class of work. This lack of consideration is often attributable to a casual impression that the forgings are too large and heavy for the turret lathe, or because there might be difficulties in chucking owing to the overhang of the work.

The next photograph, Fig. 6, shows the first operation set up for machining the spindles used on a No. 9 combination lathe. This piece is machined on a No. 20 combination lathe, and is quite large, being 10 inches finished diameter on the flange, and 3 feet 2 inches overall. The forging, which is made of .5 carbon steel, weighs 315 pounds in the rough.

In order to facilitate chucking at the second operation, it is necessary to machine the flange practically right across at the first operation; the available grip, therefore, for the first operation, is exceedingly narrow, and varies from ¼ inch to 3-16 inch, the overhang from the chuck being 38 inches. Even with this overhang the work is quite rigid, as will be seen from the nature of some of the tools, which are used without a support.

The operation is commenced by starting the hole with a short drill in a combination tool, which also turns a short way up the end to start the roller steady turners. Simultaneously with this operation, the superfluous metal is cut off the end with a tool in the square turret. The roller steady turning tool is then applied to the end, this turner being mounted on a suitable extension piece. At the same time, a tool in the square turret rough turns the portion of the spindle nearer the chuck. Having turned
